QUESTION 1

Given:

Person

```
public Person(int id)
```

```
public int getId()
```

```
public String getContactDetails()
```

```
public void setContactDetails(String contactDetails)
```

```
public String getName()
```

```
public void setName(String name)
```

```
public Person getPerson(int id) throws Exception
```

```
public void createPerson(int id) throws Exception
```

```
public Person deletePerson(int id) throws Exception
```

```
public void updatePerson(Person p) throws Exception
```

Which group of methods is moved to a new class when implementing the DAO pattern?

- A. public int getId () public String getContractDetails () public void setContactDetails (String ContactDetails) public void getName () public Person setName (String name)
- B. public int getId () public String getContractDetails () public void getName () public person getPerson (int id) throws Exception
- C. public void setContactDetails(String contactDetails) public void setName (String name)
- D. public person getPerson(int id) throws Exception public void createPerson (person p) throws exception public void deleteperson(int id) throws Exception public void updatePerson (Person p) throws Exception

Correct Answer: D

Note:Data Access Object

Abstracts and encapsulates all access to a data source

Manages the connection to the data source to obtain and store data Makes the code independent of the data sources and data vendors (e.g. plain-text, xml, LDAP, MySQL, Oracle, DB2)

QUESTION 2

Given: Which design pattern moves the getPerson, createPerson, deletePerson, and updatePerson methods to a new class?

```
Person
public Person(int id)
public int getid()
public String getContactDetails()
public void setContactDetails(String contactDetails)
public String getName()
public void setName(String name)
public Person getPerson(int id) throws Exception
public void createPerson(Person p) throws Exception
public void deletePerson(int id) throws Exception
public void updatePerson(Person p) throws Exception
```

- A. Singleton
- B. DAO
- C. Factory
- D. Composition

Correct Answer: B

We move the most abstract highest level methods into a separate class.

Abstracts and encapsulates all access to a data source

Manages the connection to the data source to obtain and store data Makes the code independent of the data sources and data vendors (e.g. plain-text, xml, LDAP, MySQL, Oracle, DB2)

QUESTION 3

Which code fragment is required to load a JDBC 3.0 driver?

- A. DriverManager.loadDriver("org.xyzdata.jdbc.network driver");
- B. Class.forName ("org.xyzdata.jdbc.NetWorkDriver");
- C. Connection con = Connection.getDriver ("jdbc:xyzdata: //localhost:3306/EmployeeDB");
- D. Connection con = Drivermanager.getConnection ("jdbc:xyzdata: //localhost:3306/EmployeeDB");

Correct Answer: B

Note that your application must manually load any JDBC drivers prior to version 4.0. The simplest way to load a driver class is to call the Class.forName() method. If the fully-qualified name of a class is available, it is possible to get the corresponding Class using the static method Class.forName().

QUESTION 4

Given:

```
class Fibonacci extends RecursiveTask {
```

```
    final int n;
```

```
    Fibonacci (int n) { this.n = n }
```

```
    Integer compute () {
```

```
        if (n
```
