QUESTION 1

Scenario: A NetScaler Engineer is working with a NetScaler appliance that has two network interface cards (NICs). The first NIC is placed on the DMZ network and the second NIC is on the internal network. The default route is configured to the gateway on the internal network. A virtual server is configured on the DMZ-network and the firewall on the DMZ is using network address translation (NAT) to allow external traffic to the virtual server.

When a user from the Internet attempts to connect to the NAT's external address, the session never establishes. The engineer performs an nstrace and sees that the user's traffic hits the NetScaler. The engineer then discovers that the problem is an asymmetrical packet flow.

Which two settings could the engineer configure to resolve the issue? (Choose two.)

- A. Link load balancing (LLB)
- B. Policy-based routing (PBR)
- C. Extended access list (ACL)
- D. MAC-based forwarding (MBF)
- E. Reverse network address translation (RNAT)

Correct Answer: BD

QUESTION 2

A network engineer is investigating a recent failure of NetScaler high availability and confirms that some recent changes were made to the configuration.

What is a likely cause of the failure?

- A. Load balancing virtual server marked DOWN.
- B. SNIP has had management access removed.
- C. RPC node password changed on an appliance.
- D. The network command policy has been modified.

Correct Answer: C

QUESTION 3

Scenario: A NetScaler engineer needs to enable access to some web servers running on an IPv6 only network. The clients connecting the services are on an IPv4 network. The engineer has already enabled IPv6 on the NetScaler.

What does the engineer need to do in order to provide access to the services on the IPv6 network?

- A. Create an IPv6 tunnel and a IPv4 virtual server.

- B. Configure an IPv6 VLAN and bind the required interface.
- C. Create a IPv4 virtual server and bind the service group to it.
- D. Create an IPv6 ACL and a IPv4 virtual server and bind the ACL to the virtual server.

Correct Answer: C

QUESTION 4

Scenario: A network engineer has configured an HTTP application to be load balanced using a virtual server named Svr1. Users have reported intermittent errors and the engineer has been given the client IP address of an affected user and asked to determine which back end service they are connected to.

Using the command-line interface, how could the engineer find this information?

- A. Show lb vServer Svr1
- B. Show system session
- C. Show lb vServer Svr1 -Summary
- D. Show lb persistentSessions Svr1

Correct Answer: D

QUESTION 5

Which step is required to ensure that SSL traffic is passed through the NetScaler to backend services without processing SSL on the NetScaler appliance?

- A. Create a service group of type SSL.
- B. Create a service group of type HTTP.
- C. Bind an SSL certificate to a service group.
- D. Bind an SSL certificate to the virtual server
- E. Create a service group of type SSL_BRIDGE.

Correct Answer: E
