QUESTION 1

Which Service-Oriented Architecture Cloud Service (SOA CS) component provides stateful orchestration?

- A. Oracle Mediator
- B. Oracle Business Activity Monitoring
- C. Oracle Service Bus
- D. Oracle Business Rules
- E. OracleBPEL Process Manager

Correct Answer: E

Reference: <http://www.oracle.com/us/products/middleware/soa/oracle-soa-suite-ds-066430.pdf>

QUESTION 2

Which feature flag lifecycle stage includes OIC features that you can request from Oracle to be disabled within your OIC instance environment?

- A. Internal Only
- B. General Availability
- C. Feature Controlled
- D. Feature Controlled General Availability

Correct Answer: C

QUESTION 3

Your design of an asynchronous OIC integration flow includes the requirement for additional processing logic that is conditionally based on the results returned to the integration instance from earlier external service invocations. You have decided to leverage the Switch action to facilitate this implementation.

Which is a valid consideration concerning the configuration and capabilities of the Switch action?

- A. Any data objects returned within a branch of a Switch action will only be visible within the implicit scope of that branch and not visible in the main flow of the integration outside of the Switch action.
- B. You may need to create conditional expressions for each branch with greater complexity because nested Switch actions are not supported.
- C. All branches within the Switch action must have a conditional expression defined.
- D. XPath version 2.0 functions can be used to create more complex conditional expressions for a branch.

Correct Answer: D

Explanation: "Define a routing expression, then click Close. XPath version 2.0 functions are supported. Base 64 encode and decode functions that process data confidentially across layers and functions that return boolean results are also supported. Functions that return nonboolean values are not supported."

QUESTION 4

Which three are characteristics of Device Virtualization?

- A. Oracle Internet of Things (IoT) Cloud Service does not support Device Virtualization.
- B. You can monitor each device endpoint's health, performance, and location via the client software library API or with REST calls made to those devices.
- C. You can collect data from your devices using APIs delivered with Oracle Internet of Things (IoT) Cloud Service Client Software Libraries or Oracle IoT Cloud Service Gateway.
- D. The APIs provided enable you to send telemetry messages and device data from your devices to Oracle Internet of Things (IoT) Cloud Service, control your devices, and deploy applications to your gateway devices.
- E. Devices used are not real. They are virtual devices and linked with Oracle Internet of Things (IoT) CS.

Correct Answer: BCD

QUESTION 5

When considering the management of plan entitlements in the API Platform Cloud Service, which two statements are valid?

- A. Two entitlements of the same plan cannot point to the same entire API, or to the same action in an API.
- B. A given API can only be entitled by one plan at a time.
- C. You must have Service Manager role permissions to manage plan entitlements.
- D. An entitlement is the relationship between a plan and an API that defines how a client application can access the API.
- E. A given plan defines entitlements to only one specific API.

Correct Answer: AD

Explanation: <https://docs.oracle.com/en/cloud/paas/api-platform-cloud/apfad/manage-api-entitlements.html#GUID-F11CD88F-F269-41B1-8236-3FC3D62014B1> Understand API Entitlements An entitlement is the relationship between an API and a Plan that defines how a client application can access the API. There is a many-to-many relationship between plans and APIs. A given plan can have entitlements to multiple APIs; for example, to group related APIs. A given API can be entitled by multiple plans; for example, to provide different quality of service criteria. Note that two entitlements of the same plan cannot point to the same entire API, or to the same action in an API.
