QUESTION 1

When performing a remote backup of system Manager data the administrator is asked for a user name and password. Which statement best explains why a user name and password are required?

A. The backed-up data file is encrypted. The username and password are used in encryption process and subsequently to access the file on restoring backed up data.

B. The backed-up data is stored on a remote server using SCP. The user name and password are used to login remote server.

C. Because System Manager Date is being exported from the server for security and authentication purpose system Manager once again checks the administrator\'s credentials.

D. All System Manager Data is backed up to common storage repository setup during installation. For system Manager to access the repository the correct user name and password must be supplied.

Correct Answer: B

QUESTION 2

Application definition allows system administrators to define and manage individual applications, each with their own attributes?

The definitions allow administrators to add one or such applications to which of the following?

A. application programs

B. application data sets

C. application sequences

D. application lists

Correct Answer: C

QUESTION 3

Application definitions allow system administrators to define and mange individual applications each with their own attributes.

The definitions allow administrators to add one or more such applications to which of the following?

A. application programs

B. application data sets

C. application sequences

D. application lists

Correct Answer: C

QUESTION 4

Session Manager has a routing policy that routes calls made to any number beginning with \\'100\\' to SIP Entity X. However, \\'sip.-1001avaya.com\\' is the SIP communication profile address of user Y. User Y is not currently registered (signed in) with Session Manager.

What will happen if Session Manager receives a call addressed to \\'sip.-1001avaya.com\\' and why?

A. It depends on the time ranges of the policy. If the call is placed inside a defined time range for the policy, the call will be routed to destination X. If not, then Session Manager will attempt to route the call to user Y. Since Y is not registered, the call will timeout, and the call will fail.

B. Since user Y is not currently registered, the call will be handled by the routing policy. If the call is placed during a time range specified by the policy, then the call will be routed to destination X. If not, then the call will fail.

C. Since the destination URI matches a communication profile SIP handle, Session Manager will not use the routing policy in handling the call. The call will fail since user Y is not currently registered.

D. Since the destination URI matches a routing policy dial pattern, Session Manager will give no consideration to the user Y registration status. If the call is made during a time range for the policy, the policy will be applied and the can will be routed to destination X. If not, then the original URI of \\'sip.-1001avaya.com\\' will be used as the destination to which Session Manager will route the call.

Correct Answer: C

QUESTION 5

What is the outcome of running SMnetsetup on a server that has an existing installation of session manager 601?

A. The network and date/time is configured on the server.

B. A System Manager System administrator login will be created.

C. The same version of the Session Manager software currently Installed is re-installed?

D. The current version of the Session Manager software is upgraded.

Correct Answer: A
