QUESTION 1

What protocol is used for Path Setup in MPLS traffic engineering?

- A. BGP
- B. PIM
- C. ISIS
- D. OSPF
- E. RSVP

Correct Answer: E

QUESTION 2

Process-level redundancy is implemented by a system manager process that creates the standby process. What two functions are provided by the system-level process called Qnet Symlink Manager (QSM)? (Choose two.)

- A. backing up the information for the broken connections
- B. provides common information for connecting processes and services
- C. detection of a failed connection
- D. provides an abstract name for a process or service
- E. distribution of symbolic link information

Correct Answer: DE

1.4. SP high end product

1.4.01. IOS-XR structure Process-Level Redundancy Process-level redundancy is implemented by a system manager process creating the standby process. Because the active process created the standby process, the active process has all the information that it needs to communicate with the standby process. The active process uses a checkpoint database to share running state with the standby process. Symbolic links and abstract names are used to identify the processes. Clients do not see the standby process until the active goes away. If a process fails and it has created a standby process, a system-level process called QNet Symlink Manager (QSM) and a library called Event Connection Manager (ECM) are used to re-establish links from the clients to the processes.

QSM provides:

Distribution of symbolic link information

Abstract name for a process or service

ECM provides:

Common information for connecting processes and services
Detection of broken connections
Only processes considered essential by development engineers are designated to support process-level redundancy. This is not a

user-

configurable option. Clients have to reconnect to the "new" active process (the "original" standby process) when they detect that the active process has failed. Clients can connect to it using the symbolic links and abstract names. The new

active process creates a new standby process.

The general steps in process redundancy are:

The active process dies.

The standby process becomes the active process.

A new standby process starts.

The new active process begins sending updates to the new standby process. Clients begin using the new active process through the symbolic links and abstract names.

QUESTION 3

Which three statements about NetFlow are true? (Choose three)

- A. NetFlow records unidirectional IP traffic flow.
- B. NetFlow records MPLS frame flow.
- C. NetFlow export is only over TCP.
- D. NetFlow records is only over UDP.
- E. NetFlow records subinterface information of traffic flow.

Correct Answer: ABE

QUESTION 4

A network engineer wants to use Telnet to access a CE device in a VRF from a PE device that runs Cisco IOS Software. How can a CE device with IP address 1.1.1.2 be accessed by the PE device?

- A. telnet 1.1.1.2 /vrf vrf-name
- B. telnet 1.1.1.2 vrf vrf name
- C. telnet 1.1.1.2 vrf
- D. telnet vrf vrf name 1.1.1.2

Correct Answer: A

QUESTION 5

Which ACL entry can be used to block Teredo tunnels?

- A. Teredo tunnels cannot be blocked
- B. deny udp any any 3544
- C. deny ipv6 udp any any 3544
- D. deny 41 any any

Correct Answer: B
