QUESTION 1

A network administrator needs to find out what assets currently exist on the network. Third-party systems need to be able to feed host data into Cisco Firepower. What must be configured to accomplish this?

- A. a Network Discovery policy to receive data from the host
- B. a Threat Intelligence policy to download the data from the host
- C. a File Analysis policy to send file data into Cisco Firepower
- D. a Network Analysis policy to receive NetFlow data from the host

Correct Answer: A

You can configure discovery rules to tailor the discovery of host and application data to your needs. The Firepower System can use data from NetFlow exporters to generate connection and discovery events, and to add host and application data to the network map. A network analysis policy governs how traffic is decoded and preprocessed so it can be further evaluated, especially for anomalous traffic that might signal an intrusion attempt-> Answer D is not correct.

QUESTION 2

How does a cloud access security broker function?

- A. It is an authentication broker to enable single sign-on and multi-factor authentication for a cloud solution.
- B. It scans other cloud solutions being used within the network and identifies vulnerabilities.
- C. It integrates with other cloud solutions via APIs and monitors and creates incidents based on events from the cloud solution.
- D. It acts as a security information and event management solution and receives syslog from other cloud solutions.

Correct Answer: C

QUESTION 3

DRAG DROP

Drag and drop the descriptions from the left onto the correct protocol versions on the right.

Select and Place:

standard includes NAT-T

uses six packets in main mode to establish phase 1

uses four packets to establish phase 1 and phase 2

uses three packets in aggressive mode to establish phase 1

uses EAP for authenticating remote access clients

IKEv1

IKEv2

Correct Answer:

IKEv1

uses six packets in main mode to establish phase 1

uses three packets in aggressive mode to establish phase 1

IKEv2

standard includes NAT-T

uses four packets to establish phase 1 and phase 2

uses EAP for authenticating remote access clients

QUESTION 5

What is an attribute of the DevSecOps process?

- A. mandated security controls and check lists
- B. security scanning and theoretical vulnerabilities
- C. development security
- D. isolated security team

Correct Answer: C

DevSecOps (development, security, and operations) is a concept used in recent years to describe how to move security activities to the start of the development life cycle and have built-in security practices in the continuous integration/continuous deployment (CI/CD) pipeline. Thus minimizing vulnerabilities and bringing security close to IT and business objectives. Three key things make a real DevSecOps environment: + Security testing is done by the development team. + Issues found during that testing is managed by the development team. + Fixing those issues stays within the development team.
