QUESTION 1

After taking a routine wireless sniffer capture on your wireless network, you found that an access point has rejected associations for a few clients with status code 30 "Association request rejected temporarily; Try again later." Which statement explains this behavior?

- A. This is a common behavior when the Call Admission Control feature is in use. The available admission capacity on the AP has been exhausted.
- B. The AP was working on a DFS channel and a RADAR pulse was detected by the AP while taking the capture. This is normal behavior of the Channel Switch Announcement functionality.
- C. The Protected Management Frames feature is enabled on the WLAN. The association request from the 802.11w client is received with the MAC address of a client that already has a valid security association with the AP.
- D. There is a high channel utilization condition on the operating channel of the AP, which results in the AP temporarily dropping any new connections.
- E. There is a possible CRC error on the capture because the reason code 30 is an invalid code. APs never reject associations temporarily.

Correct Answer: C

QUESTION 2

As per the 802.11ac standard, which statement about MU-MIMO is true?

- A. MU-MIMO can be used only in the downstream direction.
- B. MU-MIMO was introduced in 802.11ac Wave 1
- C. MU-MIMO can be used only in the upstream direction.
- D. MU-MIMO can be used in both directions, downstream and upstream.

Correct Answer: A

QUESTION 3

Why would you enable the RFC 3578 option when adding a new RADIUS authentication server to a WLC?

- A. you want to run both RADIUS and TACACS
- B. to support Disconnect and Change of Authorization
- C. to encrypt communications between the WLC and the RADIUS server
- D. to support RADIUS key wrapping

Correct Answer: B

If you are configuring a new RADIUS authentication server, choose Enabled from the Support for RFC 3576 drop-down list to enable RFC 3576, which is an extension to the RADIUS protocol that allows dynamic changes to a user session, or choose Disabled to disable this feature. The default value is Enabled. RFC 3576 includes support for disconnecting users and changing authorizations applicable to a user session and supports disconnect and change-of-authorization (CoA) messages. Disconnect messages cause a user session to be terminated immediately where CoA messages modify session authorization attributes such as data filters.

QUESTION 4

DRAG DROP

In multiple-controller deployments if one controller fails the access points perform these tasks. Drag and drop the tasks on the left into the correct order on the right.

Select and Place:

The lightweight AP attempts to contact stored mobility group members by their IP address.	Task 1	
The lightweight AP attempts to associate with the least-loaded controller to respond to its discovery message.	Task 2	
If the lightweight AP has primary, secondary, and tertiary controller assigned, it attempts to associate with that WLC.	Task 3	
The lightweight AP attempts to associate with a master controller.	Task 4	

Correct Answer:

	Task 1	If the lightweight AP has primary, secondary, and tertiary controller assigned, it attempts to associate with that WLC.
	Task 2	The lightweight AP attempts to associate with a master controller.
	Task 3	The lightweight AP attempts to contact stored mobility group members by their IP address.
	Task 4	The lightweight AP attempts to associate with the least-loaded controller to respond to its discovery message.

QUESTION 5

DRAG DROP

Select and Place:

Match the IEEE 802.11e value on the left with the appropriate WMM queue on the right.

1,2	Background
0,3	Video
6,7	Voice
4,5	Best Effort

Correct Answer:

Match the IEEE 802.11e value on the left with the appropriate WMM queue on the right.

	1,2
	4,5
	6,7
	0,3
