QUESTION 1

You have a server named dc2.contoso.com that runs Windows Server 2012 R2 and has the DNS Server server role installed. You open DNS Manager as shown in the exhibit. (Click the Exhibit button.)

You need to view the DNS server cache from DNS Manager. What should you do first?

- A. From the View menu, click Filter...
- B. From the Action menu, click Configure a DNS Server...
- C. From the Action menu, click Properties.
- D. From the View menu, click Advanced.

Correct Answer: D

To view the contents of the DNS cache, perform the following steps:

1.
Start the Microsoft Management Console (MMC) DNS snap-in (Go to Start, Programs, Administrative Tools, and click DNS).
2.
From the View menu, select Advanced.
- 3.

Select the Cached Lookups tree node from the left-hand pane to display the top-level domains (e.g., com, net) under.(root). Expand any of these domains to view the cached DNS information (the actual records will appear in the right-hand pane).

Navigating the DNS Manager console you should go to the View menu and click the Advanced tab. That will yield the DNS server cache. Reference: <http://technet.microsoft.com/en-us/library/ee683892%28v=WS.10%29.aspx>

QUESTION 2

Your network contains an Active Directory domain named contoso.com. The domain consists of 20 member servers and five domain controllers. All domain controllers run Windows Server 2012 R2. The domain contains 500 client computers.

You plan to deploy a domain controller for contoso.com in Microsoft Azure.

You need to prepare the environment for the planned deployment. The solution must ensure that the domain controller hosted in Azure always have the same IP address.

Which two actions should you perform? Each correct answer is a part of the solution.

- A. From a domain controller, run adprep.exe.
- B. From a domain controller, run the Set-NetIPAddress cmdlet.
- C. From an Azure virtual machine, run the Set-AzureStaticVNetIP cmdlet.
- D. From an Azure virtual machine, run the Set-NetIPAddress cmdlet.
- E. Deploy a site-to-site virtual private network.

Correct Answer: CE

QUESTION 3

You have a server named Server1 that runs Windows Server 2012 R2.

On Server1, you create a local user named User1.

You need to create a Group Policy object (GPO) that will apply only to User1.

What should you use?

- A. the Computer Management console
- B. the Group Policy management console
- C. the Group Policy Object Editor console
- D. the New-GPO cmdlet and the Set-GPPermission cmdlet.

Correct Answer: B

References: <https://www.petri.com/how-to-create-and-link-a-group-policy-object-in-active-directory>

QUESTION 4

You have an Active Directory domain named contoso.com. You have a domain controller named Server1 that is configured as a DNS server. Server1 hosts a standard primary zone for contoso.com. The DNS configuration of Server1 is shown in the exhibit.

You discover that stale resource records are not automatically removed from the contoso.com zone.

You need to ensure that the stale resource records are automatically removed from the contoso.com zone.

What should you do?

- A. Set the scavenging period of Server1 to 0 days.
- B. Modify the Server Aging/Scavenging properties.
- C. Configure the aging properties for the contoso.com zone.
- D. Convert the contoso.com zone to an Active Directory-integrated zone.

Correct Answer: C

Scavenging or aging as it is also known as automates the deletion of old records. When scavenging is disabled, these records must be deleted manually or the size of the DNS database can become large and have an adverse effect on performance. In the exhibit it shows that scavenging is enabled on Server1, thus you should configure the aging properties for the zone.

QUESTION 5

You have a server named Server1 that runs Windows Server 2012 R2.

You promote Server1 to a domain controller.

You need to view the service location (SRV) records that Server1 registers in DNS.

What should you do on Server1?

- A. Open the Srv.sys file.
- B. Open the Netlogon.dns file.
- C. Run ipconfig /displaydns.
- D. Run Get-DnsServerDiagnostics.

Correct Answer: B

Netlogon service creates a log file that contains all the locator resource records stored in netlogon.

Incorrect Answers:

- A: The Srv.sys file is the Timestamp server driver
- C: ipconfig /displaydns is used to display current DNS resolver cache content
- D: The Get-DnsServerDiagnostics cmdlet displays DNS event logging details
