QUESTION 1

Your network contains multiple servers that run Windows Server 2012.

You plan to implement three virtual disks. The virtual disks will be configured as shown in the following table.

Virtual disk name	Configuration
VD1	Two-way mirror
VD2	Parity
VD3	Three-way mirror

You need to identify the minimum number of physical disks required for each virtual disk.

How many disks should you identify?

To answer, drag the appropriate number of disks to the correct virtual disk in the answer area. Each number of disks may be used once, more than once, or not at all. Additionally, you may need to drag

the split bar between panes or scroll to view content.

Select and Place:

Number of Disks	Answer Area
two disks	VD1 Number of disks
three disks	VD2 Number of disks
four disks	VD3 Number of disks
five disks	

Correct Answer:

Number of Disks	Answer Area
<input type="text"/>	VD1 <input type="text" value="two disks"/>
<input type="text"/>	VD2 <input type="text" value="three disks"/>
<input type="text" value="four disks"/>	VD3 <input type="text" value="five disks"/>
<input type="text"/>	

QUESTION 2

This question consists of two statements: One is named Assertion and the other is named Reason. Both of these statements may be true; both may be false; or one may be true, while the other may be false.

To answer this question, you must first evaluate whether each statement is true on its own. If both statements are true, then you must evaluate whether the Reason (the second statement) correctly explains the Assertion (the first statement).

You will then select the answer from the list of answer choices that matches your evaluation of the two statements.

Assertion:

A company can share virtual hard disk files (.vhdx) to create a guest failover cluster without presenting the storage topology to the virtual machines.

Reason:

Failover Cluster Manager creates shared virtual hard disks automatically when you configure a guest failover cluster.

Evaluate the Assertion and Reason statements and choose the correct answer option.

- A. Both the Assertion and Reason are true, and the Reason is the Correct explanation for the Assertion.
- B. Both the Assertion and Reason are true, but the Reason is not the correct explanation for the Assertion.
- C. The Assertion is true, but the Reason is false.
- D. The assertion is false, but the Reason is true.
- E. Both the Assertion and the Reason are false.

Correct Answer: C

QUESTION 3

Your network contains servers that run only Windows Server 2012.

You have five storage pools. The storage pools are configured as shown in the following table.

Storage pool name	Contents
StoragePool1	<ul style="list-style-type: none">• Two SATA disks• One SAS disk
StoragePool2	<ul style="list-style-type: none">• Two iSCSI disks• One USB disk
StoragePool3	<ul style="list-style-type: none">• Five SAS disks• Two iSCSI disks
StoragePool4	<ul style="list-style-type: none">• Three SAS disks
StoragePool5	<ul style="list-style-type: none">• Two iSCSI disks

You need to identify which storage pools can be used as clustered disk resources.

Which storage pools should you identify? (Each correct answer presents part of the solution. Choose all that apply.)

- A. StoragePool1
- B. StoragePool2
- C. StoragePool3
- D. StoragePool4
- E. StoragePool5

Correct Answer: D

The clustered storage pool MUST be comprised of Serial Attached SCSI (SAS) connected physical disks.

Note: SAS, Serial Attached SCSI, is an evolution of parallel SCSI into a point-to-point serial peripheral interface in which controllers are linked directly to disk drives.

Incorrect Answers:

B, C, E: iSCSI and Fibre Channel controllers are not supported.

QUESTION 4

You administer an Active Directory Domain Services environment. There are no certification authorities (CAs) in the environment.

You plan to implement a two-tier CA hierarchy with an offline root CA.

You need to ensure that the issuing CA is not used to create additional subordinate CAs.

What should you do?

- A. In the CAPolicy.inf file for the issuing CA, enter the following constraint:PathLength=1
- B. In the CAPolicy.inf file for the root CA, enter the following constraint:PathLength=1
- C. In the CAPolicy.inf file for the root CA, enter the following constraint:PathLength=2
- D. In the CAPolicy.inf file for the issuing CA, enter the following constraint:PathLength=2

Correct Answer: B

You can use the CAPolicy.inf file to define the PathLength constraint in the Basic Constraints extension of the root CA certificate. Setting the PathLength basic constraint allows you to limit the path length of the CA hierarchy by specifying how many tiers of subordinate CAs can exist beneath the root. A PathLength of 1 means there can be at most one tier of CAs beneath the root. These subordinate CAs will have a PathLength basic constraint of 0, which means that they cannot issue any subordinate CA certificates.

QUESTION 5

You need to recommend a monitoring solution for Proseware.

Which three actions should you recommend performing in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Actions	Answer Area
Configure a notification subscription.	
Configure an availability monitor.	
From the Virtual Machine Manager console, configure Operations Manager integration.	
From the Operations Manager console, configure VMM integration.	
Install the Operations Manager console on the VMM server.	
Install the Virtual Machine Manager console on the Operations Manager server.	

Correct Answer:

Actions	Answer Area
	Install the Operations Manager console on the VMM server.
Configure an availability monitor.	
	From the Virtual Machine Manager console, configure Operations Manager integration.
From the Operations Manager console, configure VMM integration.	
	Configure a notification subscription.
Install the Virtual Machine Manager console on the Operations Manager server.
