QUESTION 1

Note: This question is part of a series of questions that use the same or similar answer choices. An answer choice may be correct for more than one question in the series. Each question is independent of the other questions in this series.

Information and details provided in a question apply only to that question.

Your network contains one Active Directory domain named contoso.com. The domain contains 10 domain controllers and a read-only domain controller (RODC) named RODC01. You have a domain controller named DC5 that has the Server

Graphical Shell disabled.

You create an organizational unit (OU) named OU1. From DC5, you need to create 50 new users accounts in OU1. What tool should you use?

- A. the ntdsutil command.
- B. the Set-ADDomain cmdlet.
- C. the Install-ADDSDomain cmdlet.
- D. the dsadd command.
- E. the dsamain command.
- F. the dsmgmt command.
- G. the net user command.
- H. the Set-ADForest cmdlet.

Correct Answer: D

QUESTION 2

Your network contains an Active Directory domain named contoso.com. All domain controllers run Windows Server 2012 R2.

In a remote site, a support technician installs a server named DC10 that runs Windows Server 2012 R2. DC10 is currently a member of a workgroup.

You plan to promote DC10 to a read-only domain controller (RODC).

You need to ensure that a user named Contoso\User1 can promote DC10 to a RODC in the contoso.com domain.

The solution must minimize the number of permissions assigned to User1.

What should you do?

- A. Join DC10 to the domain. Run dsmod and specify the /server switch.
- B. From Active Directory Users and Computers, run the Delegation of Control Wizard on the contoso.com domain object.
- C. From Active Directory Users and Computers, pre-create an RODC computer account.
- D. From Active Directory Administrative Center, modify the security settings of the Domain Controllers organizational unit (OU).

Correct Answer: C

QUESTION 3

Your network contains two servers named Server1 and Server2 that run Windows Server 2012 R2. Both servers have the Hyper-V server role installed. Server1 and Server2 are located in different offices. The offices connect to each other by

using a high-latency WAN link.

Server2 hosts a virtual machine named VM1.

You need to ensure that you can start VM1 on Server1 if Server2 fails. The solution must minimize hardware costs.

What should you do?

- A. From the Hyper-V Settings of Server2, modify the Replication Configuration settings. Enable replication for VM1.
- B. On Server1, install the Multipath I/O (MPIO) feature. Modify the storage location of the VHDs for VM1.
- C. On Server2, install the Multipath I/O (MPIO) feature. Modify the storage location of the VHDs for VM1.
- D. From the Hyper-V Settings of Server1, modify the Replication Configuration settings. Enable replication for VM1.

Correct Answer: D

You first have to enable replication on the Replica server--Server1--by going to the server and modifying the "Replication Configuration" settings under Hyper-V settings. You then go to VM1--which resides on Server2-- and run the "Enable Replication" wizard on VM1.

Server

- Virtual Hard Disks
C:\VHDs
- Virtual Machines
C:\VHDs\Hyper-V
- Physical GPUs
Manage RemoteFX GPUs
- NUMA Spanning
Allow NUMA Spanning
- Live Migrations
No Live Migrations
- Storage Migrations
2 Simultaneous Migrations
- Replication Configuration
Not enabled as a Replica server

User

- Keyboard
Use on the virtual machine
- Mouse Release Key
CTRL+ALT+LEFT ARROW
- Reset Check Boxes
Reset check boxes

Replication Configuration

Enable this computer as a Replica server.

Authentication and ports

Specify the authentication types to allow for incoming replication traffic. Ensure that the ports you specify are open in the firewall.

Use Kerberos (HTTP):
Data sent over the network will not be encrypted.
Specify the port:

Use certificate-based Authentication (HTTPS):
Data sent over the network will be encrypted.
Specify the port:

Specify the certificate:

Issued To:
Issued By:
Expiration Date:
Intended Purpose:

Authorization and storage

Specify the servers that are allowed to replicate virtual machines to this computer.

Allow replication from any authenticated server:
Specify the default location to store Replica files:

Allow replication from the specified servers:

Primary Server	Storage Location	Trust Group

Enable Replication for VDISRV2

Specify Replica Server

Before You Begin

- Specify Replica Server
- Specify Connection Parameters
- Choose Replication VHDs
- Configure Recovery History
- Choose Initial Replication Method
- Summary

Specify the Replica server name to use to replicate this virtual machine. If the Replica server is on a failover cluster, specify the name of the Hyper-V Replica Broker as the Replica server. Use the Failover Cluster Manager on the Replica server to find the name of the Replica Broker.

Replica server:

QUESTION 4

Your network contains an Active Directory forest named contoso.com. The forest contains a single domain. All domain controllers run Windows Server 2012 R2. The domain contains two domain controllers. The domain controllers are configured as shown in the following table.

Domain controller name	Server type	Scheduled task
DC1	Physical server	Daily snapshots of Active Directory
DC2	Hyper-V virtual machine	Daily snapshots of the virtual machine Daily backups of the system state

Active Directory Recycle Bin is enabled.

You discover that a support technician accidentally removed 100 users from an Active Directory group named Group1 an hour ago.

You need to restore the membership of Group1.

What should you do?

- A. Perform an authoritative restore.
- B. Perform tombstone reanimation.
- C. Modify the isDeleted attribute of Group1.
- D. Apply a virtual machine snapshot to DC2.

Correct Answer: A

QUESTION 5

You have a failover cluster named Cluster1 that contains four nodes. All of the nodes run Windows Server 2012 R2.

You need to force every node in Cluster1 to contact immediately the Windows Server Update Services (WSUS) server on your network for updates.

Which tool should you use?

- A. The Add-ClusterRole cmdlet
- B. The Wuauclt command

C. The Wusa command

D. The Invoke-CauScan cmdlet

Correct Answer: D

The Invoke-CauScan cmdlet performs a scan of cluster nodes for applicable updates and returns a list of the initial set of updates that would be applied to each node in a specified cluster.
