```

QUESTION 5

Your company uses an application that passes XML to the database server by using stored procedures.

The database server has a large number of XML handles that are currently active. You determine that the XML is not being flushed from SQL Server memory.

You need to identify the system stored procedure to flush the XML from memory.

Which Transact-SQL statement should you use?

- A. sp_xml_removedocument
- B. sp_xml_preparedocument
- C. sp_reserve_http_namespace
- D. sp_delete_http_namespace_reservation

Correct Answer: A

sp_xml_removedocument removes the internal representation of the XML document specified by the document handle and invalidates the document handle. sp_xml_preparedocument reads the XML text provided as input, parses the text by using the MSXML parser (Msxmlsql.dll), and provides the parsed document in a state ready for consumption. This parsed document is a tree representation of the various nodes in the XML document: elements, attributes, text, comments, and so on. A parsed document is stored in the internal cache of SQL Server. The MSXML parser uses one-eighth the total memory available for SQL Server. To avoid running out of memory, run sp_xml_removedocument to free up the memory.
