QUESTION 1

You plan to deploy a database by using SQL Server 2014.

Your company identifies the following requirements for the database:

The name of all stored procedures must start with "usp_"always.

All distribution statistics must be updated daily.

You need to identify which feature must be used to meet each database requirement.

Which features should you identify? To answer, drag the appropriate feature to the correct database requirement in the answer area.

Select and Place: Select and Place:

Features	Answer Area
change data capture	The name of all stored procedures must start with "usp_"always. Feature
the CHECK constraint	All distribution statistics must be updated daily. Feature
Extended Event	
a maintenance plan	
Policy-Based Management	

Correct Answer:

Features	Answer Area
change data capture	The name of all stored procedures must start with "usp_"always. Policy-Based Management
the CHECK constraint	All distribution statistics must be updated daily. a maintenance plan
Extended Event	

* Policy-Based Management

Each Stored Procedure that are created and that will be created has to have prefix "USP_".

* Maintenance plans create a workflow of the tasks required to make sure that your database is optimized, regularly backed up, and free of inconsistencies.

QUESTION 2

You are creating a database that will store usernames and passwords for an application.

You need to recommend a solution to store the passwords in the database.

What should you recommend?

More than one answer choice may achieve the goal. Select the BEST answer.

- A. One-way encryption
- B. Encrypting File System (EFS)
- C. Transparent Data Encryption (TDE)
- D. Reversible encryption

Correct Answer: C

*

Transparent Data Encryption (TDE) is a special case of encryption using a symmetric key. TDE encrypts an entire database using that symmetric key called the database encryption key. The database encryption key is protected by other keys or certificates which are protected either by the database master key or by an asymmetric key stored in an EKM module.

*

SQL Server provides the following mechanisms for encryption: Transact-SQL functions Asymmetric keys Symmetric keys Certificates Transparent Data Encryption Reference: Transparent Data Encryption (TDE)

QUESTION 3

You need to recommend a solution to minimize the amount of time it takes to execute USP_5. What should you include in the recommendation?

- A. Enable cross-database chaining.
- B. Use a server role to group all logins.
- C. Use the EXECUTE AS clause in USP_5.
- D. Copy USP.5 to each database.

Correct Answer: A

*

scenario: A stored procedure named USP_5 changes data in multiple databases. Security checks are performed each

time USP_5 accesses a database.

*

Cross-database ownership chaining occurs when a procedure in one database depends on objects in another database. A cross-database ownership chain works in the same way as ownership chaining within a single database, except that an unbroken ownership chain requires that all the object owners are mapped to the same login account. If the source object in the source database and the target objects in the target databases are owned by the same login account, SQL Server does not check permissions on the target objects.

QUESTION 4

You have an SQL Server 2014 server named SQL1.

You are designing a performance monitoring solution.

You need to monitor the following events on SQL1:

A deadlock graph

Missing column statistics CPU performance statistics A batch of completed Transact-SQL statements

Which two tools should you use? Each correct answer presents a complete solution.

- A. dynamic management views
- B. Database Engine Tuning Advisor
- C. SQL Server Profiler
- D. Activity Monitor
- E. Data Profile Viewer

Correct Answer: BC

Explanation: B: Database Engine Tuning Advisor examines how queries are processed in the databases you specify.

When you run a Profiler Trace and feed it to the Database Engine Tuning Advisor, it also looks for missing column statistics, and it can automatically create them for you.

C: Use SQL Server Profiler to identify the cause of a deadlock. A deadlock occurs when there is a cyclic dependency between two or more threads, or processes, for some set of resources within SQL Server. Using SQL Server Profiler, you can create a trace that records, replays, and displays deadlock events for analysis. Reference: Analyze Deadlocks with SQL Server Profiler <https://msdn.microsoft.com/en-us/library/ms188246.aspx> Reference: Mastering SQL Server Profiler, page 245

QUESTION 5

You have a SQL Server 2014 environment that includes four servers. The servers are configured as shown in the following table.

Server name	SQL Server 2014 edition	SQL Server version	Details
Server1	Enterprise	SQL Server 2014	A production Online Transaction Processing (OLTP) server
Server2	Web	SQL Server 2014	A test server
Server3	Standard	SQL Server 2012	A production report server
Server4	Express	SQL Server 2008 R2	A witness server

You plan to configure Policy-Based Management to enforce the following rules:

On Server1, enable SQL Server password policies and enable the default trace. On Server3, ensure that the names of user-defined stored procedures begin with the prefix "usp_" and ensure that all databases use a case-sensitive collation.

You need to recommend which server you must configure as a Central Management Server.

Which server should you recommend? (Each correct answer presents a complete solution.)

Choose all that apply.)

- A. Server1
- B. Server2
- C. Server3
- D. Seiver4

Correct Answer: AC

Need Standard or Enterprise edition of SQL Server.
