**QUESTION 1**

You design a web application named Marketing that is hosted on Internet Information Services (IIS). The application has the following requirements: Must include the same settings that are used in the other applications that run on the same web server.

Must use an isolated application pool named Marketing. You need to create the application pool for the Marketing application. How should you complete the relevant code? (To answer, drag the appropriate code segments to the correct drop target in the answer area. Each code segment may be used once, more than once, or not at all. You may need to drag the split

bar between panes or scroll to view content.)

Select and Place:

```
private static void Main()
{
    using(ServerManager serverManager = new ServerManager())
    {
        Configuration config =
        {
            serverManager.
        };

        ConfigurationSection applicationPoolsSection =
            config.GetSection("system.applicationHost/");

        ConfigurationElementCollection applicationPoolsCollection =
            applicationPoolsSection.GetCollection();

        addSample =
        {
            applicationPoolsCollection.CreateElement("add");
            addSample["name"] = @"Marketing";
            applicationPoolsCollection.Add(addSample);
            serverManager.CommitChanges();
        }
    }
}
```

Correct Answer:

sites

GetAdministrationConfiguration(...)

ConfigurationElementCollection

Answer Area

```
private static void Main()
{
    using(ServerManager serverManager = new ServerManager())
    {
        Configuration config =
            serverManager.GetApplicationHostConfiguration();

        ConfigurationSection applicationPoolsSection =
            config.GetSection("system.applicationHost/
                applicationPools");

        ConfigurationElementCollection applicationPoolsCollection =
            applicationPoolsSection.GetCollection();

        ConfigurationElement addSample =
            applicationPoolsCollection.CreateElement("add");
        addSample["name"] = @"Marketing";
        applicationPoolsCollection.Add(addSample);
        serverManager.CommitChanges();
    }
}
```

QUESTION 2

You are designing an ASP.NET Web application. Each page of the Web application will have a common master page and derive from a common base page class. You have the following requirements:

Support multiple languages for user interface labels.

Enable automatic detection of language based on browser language settings.

You need to recommend an approach to support localization.

What should you recommend?

A.

In the code-behind for the master page, override the OnInit() method. Set the Thread.CurrentThread.CurrentUICulture property based on the value of the Request.Browser.Capabilities("preferredLanguage") dictionary entry.

B.

In the code-behind for the base page, override the InitializeCulture() method. Set the Thread.CurrentThread.CurrentUICulture property based on the value of the ViewState("Accept- Language") dictionary entry.

C.

In the Web.config file, add a globalization element with the uiCulture attribute set to auto.

D.

In the Web.config file, add a globalization element with the responseEncoding attribute set to auto.

Correct Answer: C

QUESTION 3

You need to plan for authentication and authorization of Web application users. Which approach should you recommend?

- A. Use the Membership API.
- B. Use the Personalization API.
- C. Use the Local Security Policy.
- D. Use the Group Policy Manager.

Correct Answer: A

QUESTION 4

You are redesigning an existing three-tier ASP.NET Web application that is deployed to a Web server, an application server, and a database server that runs Microsoft SQL Server 2008.

Usage has increased significantly. The application has become slow and occasionally times out. Health monitoring logs indicate that the data access logic on the application server is consuming the majority of the CPU resources.

You need to recommend an approach for addressing the scalability and reliability issues.

Which two actions should you recommend? (Each correct answer presents part of the solution. Choose two.)

- A. Partition the tables and indexes in the database.
- B. Move the application tier to a Web farm.
- C. Move the Web tier to a Web farm.
- D. Use a clustered database server configuration.

Correct Answer: BD

QUESTION 5

You are designing an ASP.NET Web application that targets multiple browsers and form factors.

Some devices do not support the markup produced by a third-party server control. You cannot modify the third-party server control.

You need to recommend an approach for providing the correct markup for the problematic devices.

What should you recommend?

- A. Derive a class from the third-party server control. In the new server control, override the TemplateSourceDirectory property to return a value pointing to a file containing the device- specific markup.
- B. Create an ASP.NET theme specific to each problematic device. In the page PreRender event, set the Theme property to the custom theme based on the value of the Request.Browser.Type property.
- C. In the page PreRender event, call the Response.WriteSubstitution() method with a delegate. In the delegate, populate the page with device-specific markup based on the value of the Request.Browser.Type property.
- D. Derive a class from ControlAdapter that produces device-specific markup. In the browser definition file, add an entry in the controlAdapters collection for each of the problematic devices. In the entry, point to the third-party server control and adapter type.

Correct Answer: D
