QUESTION 1

You manage a web application published to Azure Cloud Services.

Your service level agreement (SLA) requires that you are notified in the event of poor performance from customer locations in the US, Asia, and Europe.

You need to configure the Azure Management Portal to notify you when the SLA performance targets are not met.

What should you do?

- A. Create an alert rule to monitor web endpoints.
- B. Create a Notification Hub alert with response time metrics.
- C. Add an endpoint monitor and alert rule to the Notification Hub.
- D. Configure the performance counter on the cloud service.

Correct Answer: A

*

An alert rule enables you to monitor an available metric within a supported Azure service. When the value of a specified metric violates the threshold assigned for a rule, the alert rule becomes active and registers an alert. When you create an alert rule, you can select options to send an email notification to the service administrator and co-administrators, or another administrator, when the rule becomes active, and when an alert condition is resolved.

*

You can configure cloud service alert rules on: Web endpoint status metrics Monitoring metrics from the cloud service host operating system Performance counters collected from the cloud service guest virtual machine. References: <http://msdn.microsoft.com/en-us/library/azure/dn306639.aspx>

QUESTION 2

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some questions sets might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

A company plans to use Operations Management Suite (OMS) to track changes within virtual machines (VMs).

The company requires that data collection occur at least every 15 minutes.

You need to recommend a solution to monitor VMs which ensures that data collection occurs at least every 15 minutes.

Solution: Monitor files on Windows VMs.

Does the solution meet the goal?

A. Yes

B. No

Correct Answer: B

References: <https://docs.microsoft.com/en-us/azure/virtual-machines/windows/monitor>

QUESTION 3

DRAG DROP

You manage an application deployed to a cloud service that utilizes an Azure Storage account.

The cloud service currently uses the primary access key.

Security policy requires that all shared access keys are changed without causing application downtime.

Which three steps should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Action	Answer Area
Update the cloud service configuration with the primary access key.	
Regenerate the primary access key.	
Regenerate the secondary access key.	
Update the cloud service configuration with the secondary access key.	

Correct Answer:

Action	Answer Area
Update the cloud service configuration with the primary access key.	Regenerate the secondary access key.
	Update the cloud service configuration with the secondary access key.
	Regenerate the primary access key.

QUESTION 4

You use Azure Backup to back up a System Center Data Protection Manager Server.

You create a backup vault and add it to DPM server.

You need to ensure that you don't accrue any extra cost.

What steps should you take? Select all that apply.

- A. Disable the Azure Backup agent
- B. Reissue the vault credential file
- C. Change the storage redundancy option
- D. Change the retention policy

Correct Answer: CD

System Center Data Protection Manager (DPM) is a Microsoft backup solution. The configuration of this backup solution is based on Protection Groups. A protection group contains several data sources that share same configuration such as backup duration (Short-term or Long-term), retention range etc.

QUESTION 5

HOTSPOT You manage a Kubernetes cluster in Azure Container Service. You run the `kubectl get pods` Windows PowerShell command and receive the following output.

NAME	READY	STATUS	RESTARTS	AGE
azure-vm-back-2549686872-4d2r5	1/1	Running	0	31m
azure-vm-front-848767080-tf34m	1/1	Running	0	31m

You need to use Azure CLI to increase the number of virtual machines (VMs) available in the azure-vmback deployment to five.

How should you complete the command? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

kubectl --replicas= deployment/azure-vm-back

	▼
autoscale	
get	
scale	
deployment	

	▼
1	
3	
4	
5	

Correct Answer:

Answer Area

kubectl --replicas= deployment/azure-vm-back

	▼
autoscale	
get	
scale	
deployment	

	▼
1	
3	
4	
5
