## QUESTION 1

Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is exactly the same in each question in this series.

Start of repeated scenario.

Your company has a network that contains an Active Directory forest named fabrikam.com. The forest is synchronized to a Microsoft Azure Active Directory (Azure AD) tenant and has an Azure subscription.

The company also has an Azure AD tenant named contoso.com. Contoso.com has an Azure subscription. Contoso.com includes foreign principals.

The network contains the computers configured as shown in the following table.

Computer name	Operating system	Configuration
Server1	Windows Server 2016 Datacenter	Hyper-V host that hosts two test virtual machines
Server2	Windows Server 2016 Datacenter	Microsoft SQL Server 2016 server primary replica of an Always On availability group in a cluster named Cluster1
Server3	Windows Server 2016 Datacenter	Microsoft SQL Server 2016 server, secondary replica of an Always On availability group in Cluster1
Server4	Windows Server 2016 Datacenter	Member of Cluster1
Server5	Windows Server 2016 Datacenter	File server
Client1	Windows 10 Enterprise	Privileged access workstation

Fabrikam.com contains a user named User1.

For operating system deployment, the company uses a custom operating system image of Windows Server 2016 Datacenter named Image1.

You have an Azure Stack integrated system that is accessed by using the following endpoints:

<https://portal.fabrikam.com>

<https://adminportal.fabrikam.com> <https://management.fabrikam.com> Privileged endpoint: 192.168.100.100 Hardware lifecycle host: 192.168.101.101 <https://adminmanagement.fabrikam.com>

You onboard contoso.com as a guest directory tenant on the Azure Stack integrated system.

You implement in the following Azure Stack providers:

SQL Server

App Service

End of repeated scenario.

You need to ensure that the foreign principals for contoso.com can access Azure Stack services.

Which URL should the foreign principals use to sign in to Azure Stack?

- A. <https://portal.fabrikam.com>
- B. <https://adfs.fabrikam.com/contoso.com>
- C. <https://portal.fabrikam.com/contoso.com>
- D. <https://adminportal.fabrikam.com/contoso.com>

Correct Answer: C

---

## QUESTION 2

You implement an Azure Stack integrated system.

You receive the following Service Fabric warning alert: "The infrastructure role FabricResourceProvider is experiencing issues."

You contact Microsoft support and are instructed to modify the configuration of the Azure Stack integrated system.

You successfully modify the configuration.

You need to restart the Azure Stack integrated system.

What should you do first?

- A. From the Azure Stack administrator portal, restart the infrastructure role.
- B. From the Azure Stack administrator portal, stop the infrastructure role.
- C. Connect to the privileged endpoint.
- D. Connect to the Azure Resource Manager administrative endpoint.

Correct Answer: C

### QUESTION 3

#### HOTSPOT

You have an Azure Stack integrated system.

You need to install the Azure Stack-compatible Azure PowerShell modules on a management workstation.

You set the \$profile variable to the correct API version.

Which commands should you run? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

### Answer Area

Install-Module -Name 

AzureRm.BootStrapper
AzureRmProfile
AzureStack

 -Force

Get-AzureRmProfile
Select-AzureRmProfile
Use-AzureRmProfile

 -Profile profile\$ -Force

Correct Answer:

## Answer Area

```
Install-Module -Name 

|                      |
|----------------------|
| AzureRm.BootStrapper |
| AzureRmProfile       |
| AzureStack           |

 -Force
```

```

|                       |
|-----------------------|
| Get-AzureRmProfile    |
| Select-AzureRmProfile |
| Use-AzureRmProfile    |

 -Profile profile$ -Force
```

### QUESTION 4

You plan to create a Linux virtual machine on an Azure Stack integrated system.

You download an Ubuntu Server image.

Which authentication method can use to access the Linux virtual machine by using SSH?

- A. The Extensible Authentication Protocol (EAP)
- B. a Kerberos token
- C. a service principal
- D. a password

Correct Answer: D

When you create you Linux VM via the portal or the CLI, you have two authentication choices. If you choose a password for SSH, Azure configures the VM to allow logins via passwords. If you chose to use an SSH public key, Azure configures the VM to only allow logins via SSH keys and disables password logins. To secure your Linux VM by only allowing SSH key logins, use the SSH public key option during the VM creation in the portal or CLI.

### QUESTION 5

You have an Azure Stack integrated system that has a SQL Server resource provider.

You need to remove the resource provider.

Which three types of objects should you delete before you run the deployment script? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. user databases
- B. Default Subscription Provider
- C. storage accounts
- D. hosting servers
- E. plans

Correct Answer: ADE

To remove the SQL resource provider, it is essential to first remove any dependencies:

1.  
Ensure that you have the original deployment package that you downloaded for this version of the SQL resource provider adapter.

2.  
All user databases must be deleted from the resource provider. (Deleting the user databases doesn't delete the data.) This task should be performed by the users themselves.

3.  
The administrator must delete the hosting servers from the SQL resource provider adapter.

4.  
The administrator must delete any plans that reference the SQL resource provider adapter.

5.  
The administrator must delete any SKUs and quotas that are associated with the SQL resource provider adapter.

6.  
Rerun the deployment script with the following elements: The -Uninstall parameter The Azure Resource Manager endpoints The DirectoryTenantID The credentials for the service administrator account
