### QUESTION 1

Your network contains three servers named Server1, Server2, and Server3.

Server1 and Server2 are accessible from the internal network only.

Server3 is located on a perimeter network.

Users connect to Server1 and Server2 to run RemoteApp programs.

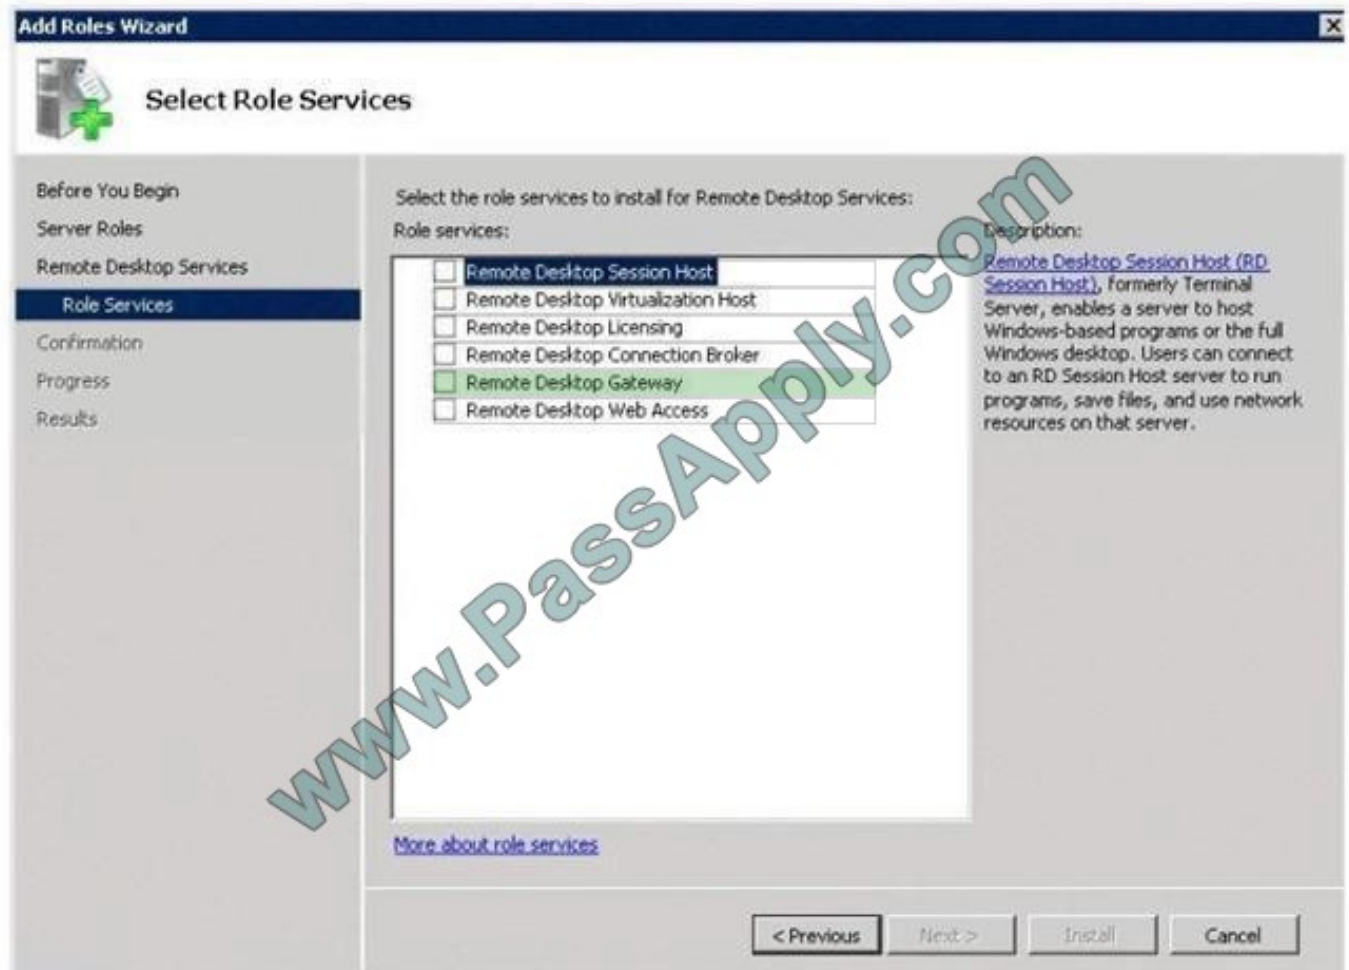

You need to ensure that remote users can run the RemoteApp programs on Server1 and Server2. The solution must minimize the number of ports that must be opened on the internal firewall. Which role service or role services from the Add

Roles Wizard should you install on Server3? To answer, select the appropriate role service or role services in the answer area. Select only the required role service or role services.

Point and Shoot:

Correct Answer:

Original MS exam have an typing error in this question. You must read "Server1" instead of "Server3". select RD Gateway Role

## QUESTION 2

Your network contains a Web server that runs Windows Server 2008 R2. The server contains 10 Web sites. You need to back up the Microsoft ASP.NET configuration settings of one Web site. The solution must minimize the size of the backup.

What should you do?

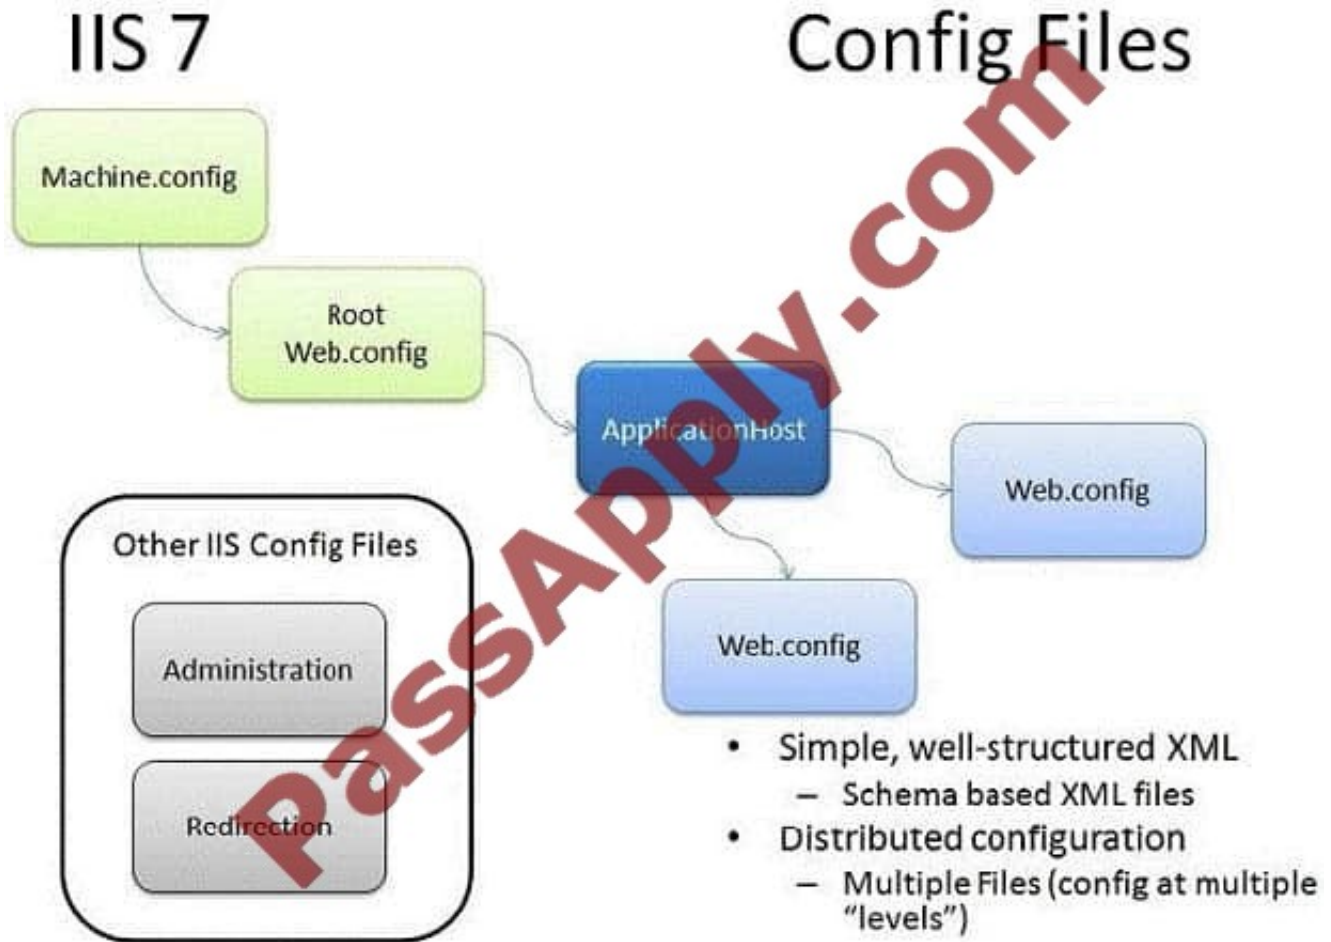

- A. Perform a system state backup.
- B. Copy the Web.config file.
- C. Copy the ApplicationHost.config file.
- D. Copy the %systemdrive%\inetpub folder.

Correct Answer: B

In the web content directories, there may be optional web.config files that control the behavior for their level of the

hierarchy and downward. They could be local or remote (if the content directory is on a UNC share, for example). They may contain IIS, ASP.NET or any other .NET framework configuration settings that can be specified at their level. By default there are no web.config files.

### QUESTION 3

Your company has a single Active Directory domain named contoso.com. All servers in the domain run Windows Server 2008 R2.

The DNS Server server role is installed on two domain controllers named DC1 and DC2. Both DNS servers host Active Directory-integrated zones that are configured to allow the most secure updates only.

DC1 has Key Management Service (KMS) installed and activated. You discover that the service locator records from the contoso.com zone hosted on DC1 and DC2 are missing.

You need to force registration of the KMS service locator records in the contoso.com zone.

What should you do?

A. Configure the contoso.com zone to accept non-secure updates.

- B. On DC1 at the command prompt, run the slmgr.vbs rearm script.
- C. On DC1 at the command prompt, run the net stop slsvc command, and then run the net start slsvc command.
- D. On DC2 at the command prompt, run the net stop netlogon command, and then run the net start netlogon command.

Correct Answer: C

A KMS host will automatically update its SRV entries if the software licensing service (slsvc.exe) detects that the computer name or TCP port has changed during service startup. It will also update them once each day, in order to ensure that they are not automatically removed (scavenged) by the DNS system. ---

#### QUESTION 4

Your company contains an Active Directory domain named adatum.com. The domain contains a server named Servers that runs Windows Server 2008 R2 Service Pack 1 (SP1).

Server5 is configured as a file and print server.

Server5 contains three dynamic disks named HardDisk1, HardDisk2 and HardDisk3. HardDisk1 has a volume that contains critical data. HardDisk2 and HardDisk3 do not contain any volumes.

You need to create a mirror of the volume on HardDisk1.

Which Diskpart command should you run?

- A. GPT
- B. online
- C. list
- D. filesystems
- E. merge vdisk
- F. create
- G. attach vdisk
- H. automount
- I. retain
- J. assign
- K. add
- L. compact vdisk
- M. extend
- N. offline

- O. break
- P. attributes
- Q. remove
- R. recover
- S. format
- T. rescan
- U. repair
- V. active
- W. expand vdisk
- X. detach vdisk

Correct Answer: K

Mirrors the simple volume with focus to the specified disk. add disk= [align=] [wait] [noerr]

To create a mirror of the volume with focus on disk 2, type: Add disk=2

## QUESTION 5

Your network consists of a single Active Directory domain. The network contains a Remote Desktop Session Host Server that runs Windows Server 2008 R2, and client computers that run Windows 7. All computers are members of the domain.

You deploy an application by using the RemoteApp Manager. The Remote Desktop Session Host Server's security layer is set to Negotiate.

You need to ensure that domain users are not prompted for credentials when they access the application.

What should you do?

- A. On the server, modify the Password Policy settings in the local Group Policy.
- B. On the server, modify the Credential Delegation settings in the local Group Policy.
- C. On all client computers, modify the Password Policy settings in the local Group Policy.
- D. On all client computers, modify the Credential Delegation settings in the local Group Policy.

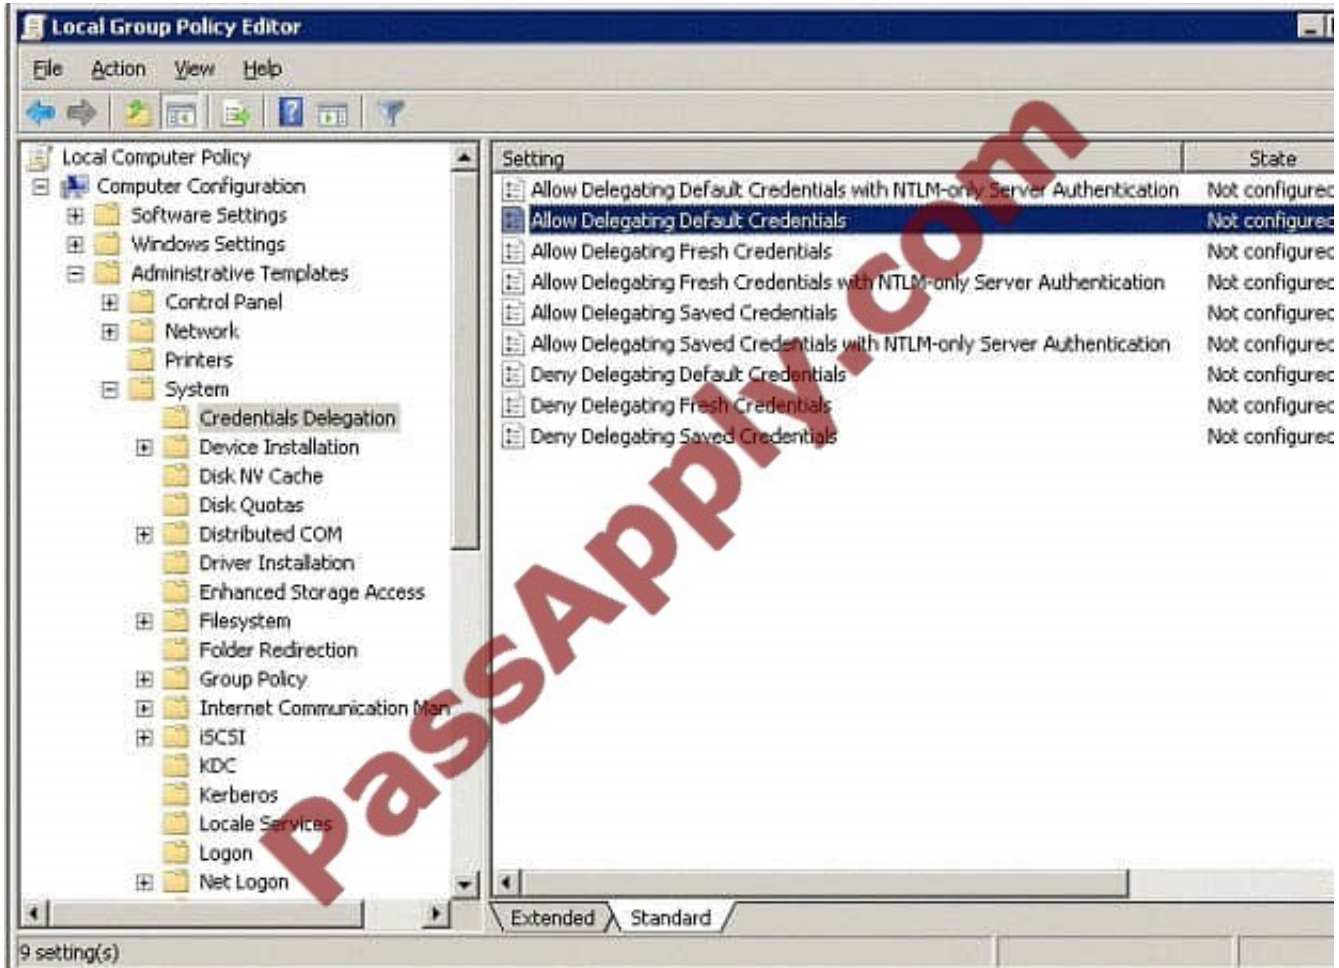

Correct Answer: D

Configuration CredSSP policies, and by extension the SSO functionality they provide to Terminal Services, are configured via Group Policy. Use the Local Group Policy Editor to navigate to Local Computer Policy\Computer

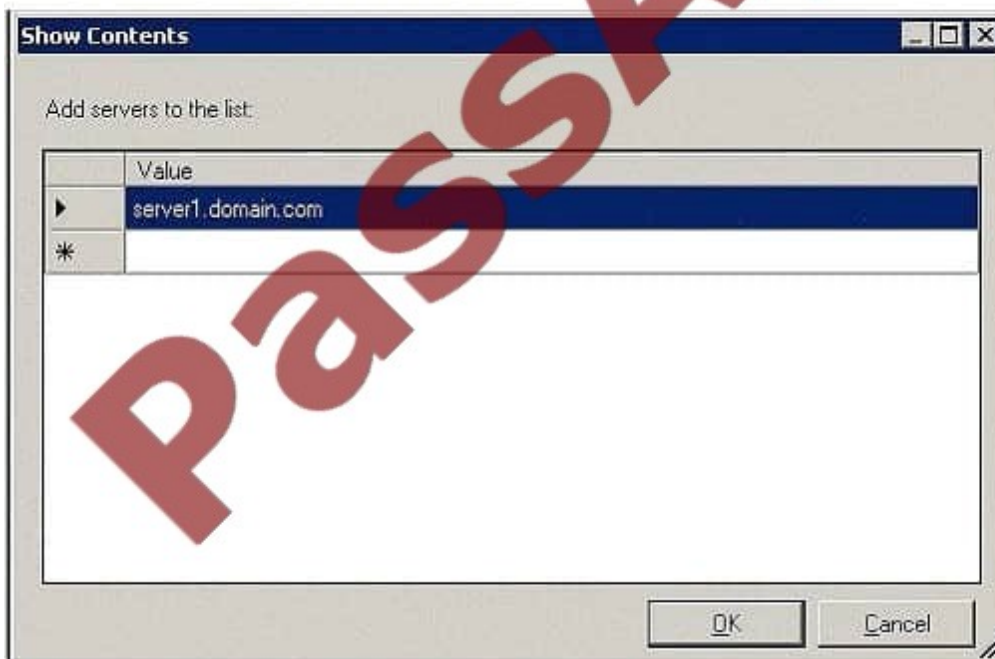

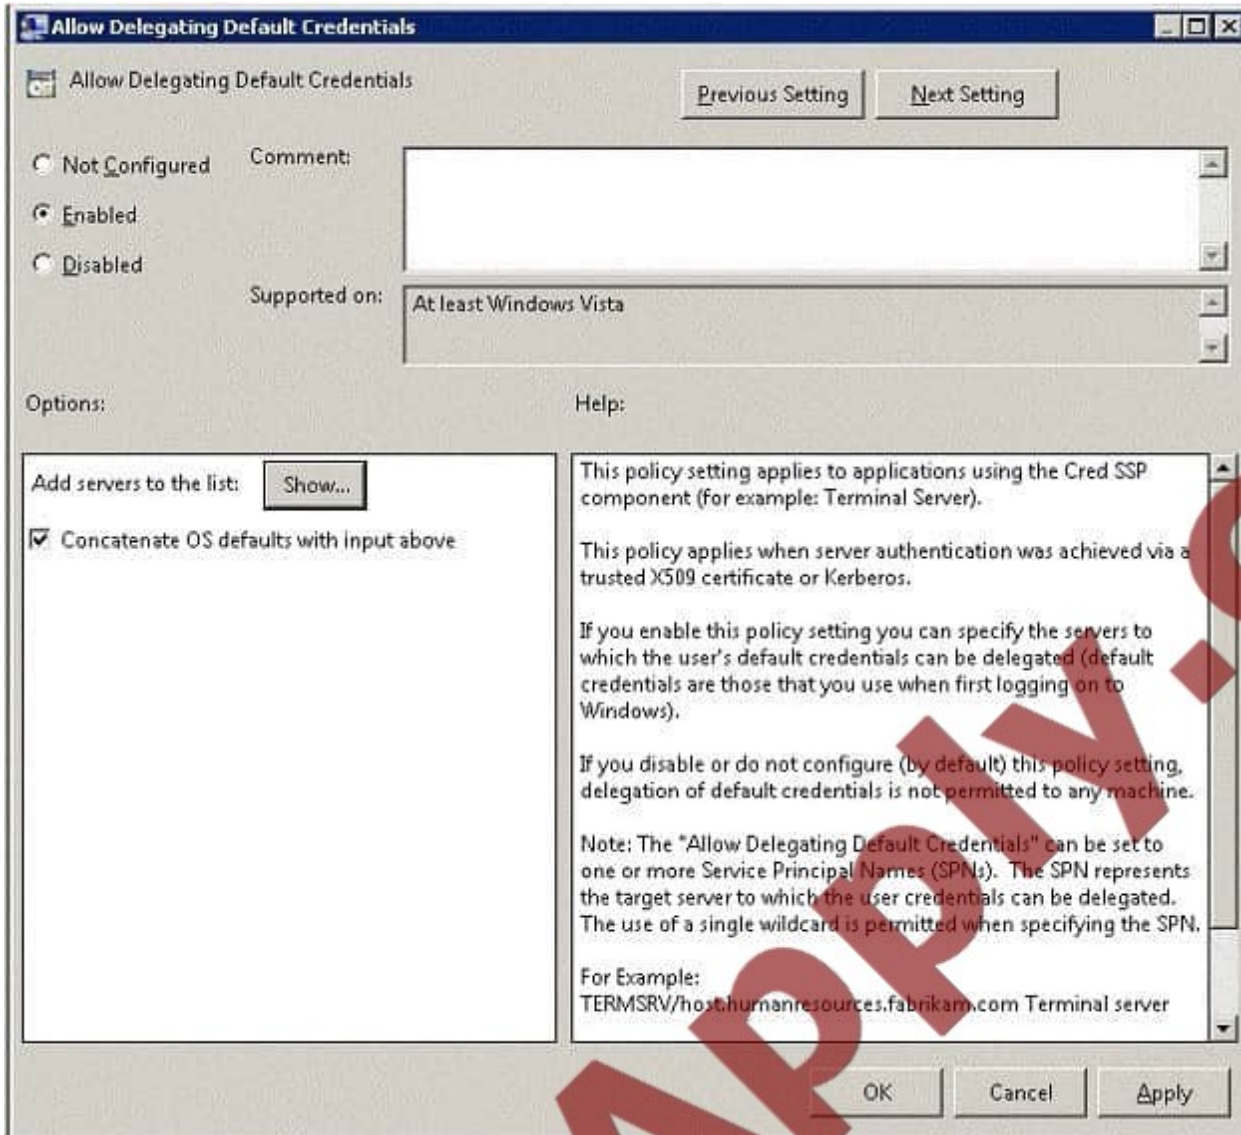

Configuration\Administrative Templates\System\Credentials Delegation , and enable one or more of the policy options.  
Source: [http://technet.microsoft.com/en-us/library/cc749211\(WS.10\).aspx](http://technet.microsoft.com/en-us/library/cc749211(WS.10).aspx)

One needs to enable the policy on the client computers, because one want to allow the client computer to reuse the credentials.

Navigate to Computer Configuration | Administrative Templates | System | Credentials Delegation Enable the Allow Delegating Default Credentials Setting
