QUESTION 1

Your network contains an Active Directory forest named contoso.com. The forest contains a server named Server1 that is configured as an enterprise certification authority (CA). The forest contains a server named Server2 that has the Network Policy Server (NPS) role service installed.

You deploy Network Access Protection (NAP).

You discover that Server1 fails to issue health certificates. You need to ensure that health certificates can be issued. What should you do?

- A. Install an additional server, configure the new server as a standalone CA, and then configure the Health Registration Authority (HRA) to use the CA.
- B. From the Network Policy Server console, create a new health policy.
- C. From the Network Policy Server console, modify the Windows System Health Validators settings.
- D. Install the Host Credential Authorization Protocol (HCAP) role service on Server1.

Correct Answer: A

QUESTION 2

You manage a Web server named Server1 that runs Windows Server 2008 R2. Server1 hosts five Web sites.

You discover that the CPU utilization of Server1 is abnormally high.

You need to view the amount of CPU resources that each Web site is using.

Which tool should you use?

- A. Component Services
- B. lisreset
- C. Internet Information Services (IIS) Manager
- D. Internet Information Services (IIS) 6.0 Manager
- E. FTP
- F. Local Security Policy
- G. Performance Monitor
- H. Security Configuration wizard (SCW)
- I. Services
- J. System Configuration
- K. Telnet

L. Windows Firewall

Correct Answer: C

The old answer was: Performance Monitor Performance Monitor ?it is not better tool than IIS Manager, because it provides same functionality as "Worker processes" tab of IIS Manager, but in Performance Monitor you need to configure list of counters before you see their values unlike as in IIS Manager, which displays all application pools and they cpu usage in one click. PS. "Web site" is not equal to "application pool", and I did not find any possibility to track "web site CPU usage" in Windows Server 2008R2.

QUESTION 3

Your network contains two servers. The servers are configured as shown in the following table:

Server name	Server configuration
Server1	Windows Server 2008 R2 Enterprise (64-bit) Remote Desktop Session Host (RD Session Host)
Server2	Windows Server 2008 R2 Enterprise (64-bit) Remote Desktop Web Access (RD Web Access)

All client computers run the 32-bit version of Windows Vista.

Your company purchases a new sales application named SalesApp1.

SalesApp1 is a 64-bit application.

SalesApp1 is associated with the .abc file extension.

You need to ensure that when users in the sales department open files that have the .abc file extension, SalesApp1 automatically opens.

What should you do?

To answer, move the appropriate actions from the Possible Actions list to the Necessary

Actions area and arrange them in the correct order.

Build List and Reorder:

Ordered List Title	Answer Choices Title
<div><div>▲ ▼</div><div></div></div>	<div>Install SalesApp1 on Server2</div> <div>Create a RemoteApp program on Server2</div> <div>Create a Remote Desktop Connection (.rdp) file</div> <div>Create a Windows Installer package for SalesApp1</div> <div>Deploy the Windows Installer package by using a Group Policy object (GPO)</div> <div>Deploy the Remote Desktop Connection (.rdp) file by using a Group Policy object (GPO)</div>
<div><< Move Remove >></div>	

Correct Answer:

Ordered List Title	Answer Choices Title
<div><div>▲ ▼</div><div>Install SalesApp1 on Server2</div><div>Create a RemoteApp program on Server2</div><div>Create a Windows Installer package for SalesApp1</div><div>Deploy the Windows Installer package by using a Group Policy object (GPO)</div></div>	<div>Create a Remote Desktop Connection (.rdp) file</div> <div>Deploy the Remote Desktop Connection (.rdp) file by using a Group Policy object (GPO)</div>
<div><< Move Remove >></div>	

QUESTION 4

Your network contains an Active Directory domain. The domain contains an enterprise certification authority (CA) named Server1 and a server named Server2.

On Server2, you deploy Network Policy Server (NPS) and you configure a Network Access Protection (NAP) enforcement policy for IPsec.

From the Health Registration Authority snap-in on Server2, you set the lifetime of health certificates to four hours.

You discover that the validity period of the health certificates issued to client computers is one year.

You need to ensure that the health certificates are only valid for four hours.

What should you do?

- A. On Server1, run `certutil.exe -setreg policy\editflags + editf_attributeenddate`.
- B. On Server1, run `certutil.exe -setreg dbflags + dbflags_enablevolatilerequests`.
- C. Modify the Request Handling settings of the certificate template used for the health certificates.
- D. Modify the Issuance Requirements settings of the certificate template used for the health certificates.

Correct Answer: A

QUESTION 5

You are evaluating whether to purchase Windows Server 2008 R2 Service Pack 1 (SP1).

Several weeks ago, you installed Windows Server 2008 R2 SP1 on a server. During the installation, you did not enter a product key.

You need to identify how many days remain until the license status of the server will change to Unlicensed.

Which tool should you use?

- A. `slmgr.vbs`
- B. Action Center
- C. `Wevutil.exe`
- D. System Configuration

Correct Answer: A

`slmgr.vbs -dli`

Display license information.

By default, `/dli` displays the license information for the installed active Windows edition. Specifying the `[Activation ID]` parameter displays the license information for the specified edition associated with that Activation ID. Specifying the `[All]` as

the parameter will display all applicable installed products\\' license information. This operation does not require elevated privileges.
