### QUESTION 1

A corporate environment includes Exchange Server 2010 and Active Directory Domain Services (AD DS).

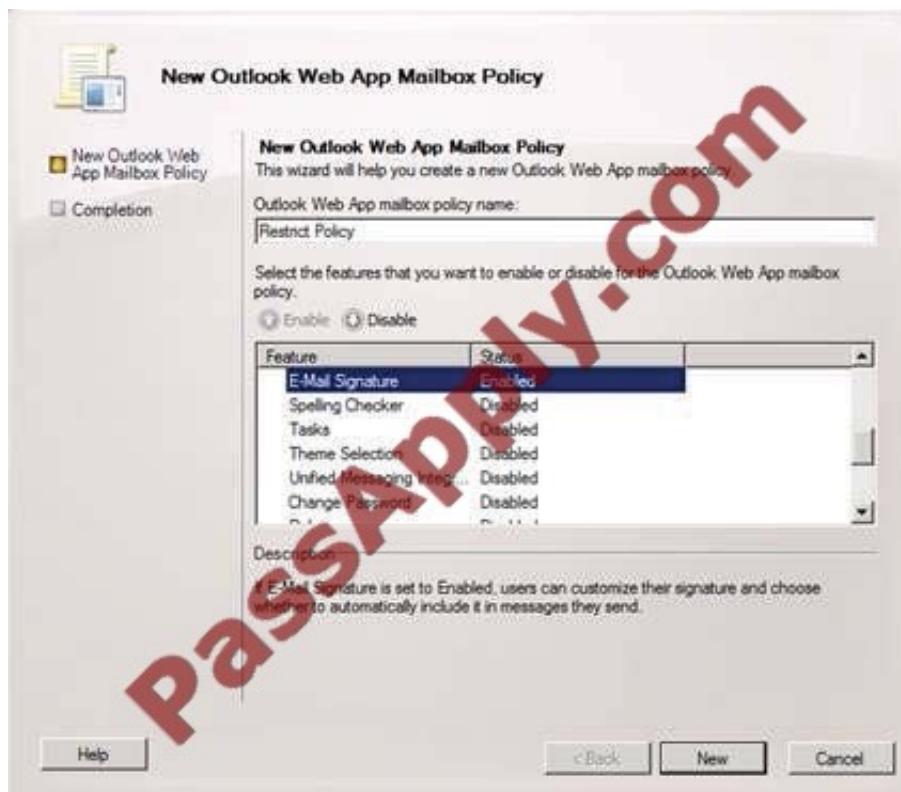

You need to recommend a solution for preventing a specific group of users from changing their AD DS passwords in Outlook Web App (OWA). The solution must not affect other users.

What should you recommend?

- A. Create a new Outlook Web App mailbox policy
- B. Configure the authentication settings on the OWA virtual directory
- C. Configure OWA virtual directory segmentation
- D. Create a new managed folder mailbox policy

Correct Answer: A

Use Microsoft Office Outlook Web App mailbox policies to create organization-level policies to manage access to features in Outlook Web App. Outlook Web App mailbox policies allow you to create multiple policies at the organization level and apply them to individual mailboxes.

### QUESTION 2

You have an Exchange Server 2010 organization.

You plan to delegate administration of the organization.

You have a group named Technicians that contains all the level-two technicians in the organization.

You need to ensure that the Technicians group can manage the properties of all the mailbox databases. The solution must minimize the number of permissions assigned to the Technicians group.

Which management role should you assign to the Technicians group?

- A. Help Desk
- B. Organization Management
- C. Recipient Management
- D. Server Management

Correct Answer: D

Administrators who are the members of server management role group have administrative access to Exchange 2010 server configuration. They don't have access to administer Exchange 2010 recipient configuration.

---

### QUESTION 3

A company named Contoso, Ltd. has offices in Montreal, Seattle, and Denver. An Active Directory site exists for each office. Only the Montreal site is connected to the Internet.

You are designing an Exchange organization for Contoso. All servers in the organization will have Exchange Server 2010 Service Pack 1 (SP1) installed.

Each office will contain two Exchange servers that each has the Mailbox, Hub Transport, and Client Access server roles installed.

You need to recommend a deployment solution for the Client Access servers.

Which of the following solutions is the best recommendation? (More than one answer choice may achieve the goal. Select the BEST answer.)

- A. One Client Access server array in each office Round-robin DNS in each office
- B. A load balancing solution in each office Round-robin DNS in the Montreal office
- C. One Client Access server array in each office A load balancing solution in each office
- D. One Client Access server array that contains all of the Client Access servers A load balancing solution in the Montreal office

Correct Answer: C

---

### QUESTION 4

## Exchange Server 2010 Outlook Web App Authentication Types

There are four authentication methods available for Exchange Server 2010 OWA. They are:

**Integrated Authentication** – this allows domain users who are logged on to domain computers to automatically logon to Outlook Web App. This is useful for internal Outlook Web App access as it simplifies the logon process for domain users (they don't need to logon once to the computer and then a second time for OWA). However Integrated Authentication is not suitable for remote access by people using non-domain member computers, or people who are connecting via proxy servers.

A corporate environment includes a main office and a branch office.

The company plans to deploy Exchange Server 2010. The Mailbox servers will be part of a single database availability group (DAG) that spans both locations. There is only intermittent connectivity between the two locations.

You need to recommend a public folder database solution that enables users from either location to consistently access public folders.

Which two actions should you recommend? (Each correct answer presents part of the solution. Choose two.)

- A. Create a single public folder database in the branch office and add it as a replica for the public folders.
- B. Configure public folder referrals between the main office and the branch office.
- C. Create a single public folder database in the main office and add it as a replica for the public folders.
- D. Configure cross-site RPC Client Access on the DAG.

Correct Answer: AC

### QUESTION 5

You have an Exchange Server 2003 organization.

Users access public folders by using Microsoft Office Outlook 2003 and Outlook Web Access.

You plan to transition the organization to Exchange Server 2010.

You need to ensure that users can access public folders after their mailboxes have been moved to Exchange Server 2010.

What should you do?

- A. Enable public folder referrals.
- B. Run the New Organization Relationship wizard.
- C. Create public folder replicas on an Exchange Server 2010 server.
- D. Run the Microsoft Exchange Inter-Organization Application tool from an Exchange Server 2003 server.

Correct Answer: C

Public folders, introduced in the first version of Microsoft Exchange, are designed for shared access and provide an easy and effective way to collect, organize, and share information with other people in your work group or organization. Public folders are hierarchically organized, stored in dedicated databases, and can be replicated between servers running Exchange.

Public Folder Database Creation During Setup Computers running Outlook 2003 and earlier or Microsoft Entourage require a public folder database (previously called the public folder store) to connect to Exchange. Therefore, in a pure Exchange 2010 organization, as you install the Mailbox server role on the first server. Setup prompts you with the question: Do you have any client computers running Outlook 2003 and earlier or Entourage in your organization? If the answer is yes, a public folder database is created. If the answer is no, a public folder database isn't created.
