QUESTION 3

DRAG DROP

Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of thescenario is exactly the same in each question in this series.

Start of repeated scenario

Your network contains an Active Directory domain named contoso.com. The functional level of the domain is Windows Server 2012.

The network uses an address space of 192.168.0.0/16 and contains multiple subnets.

The network is not connected to the Internet.

The domain contains three servers configured as shown in the following table.

Server name	Configuration
Server1	Domain controller and DNS server
Server2	Member server
Server3	DHCP server

Client computers obtain TCP/IP setting from Server3.

You add a second network adapter to Server2. You connect the new network adapter to the Internet. You install the Routing role service on Server2.

DNS zone name	Type	Zone file name
Contoso.com	Active Directory-integrated	*None*
Fabrikam.com	Primary	Fabrikam.com.dns
Tailspintoys.com	Primary	Tailspintoys.com.dns
168.192.in-addr.arpa	Primary	168.192.in-addr.arpa.dns

End of repeated scenario

You need to ensure that computers in the domain can resolve the following:

1.

The name server2.contoso.com to the name nat.contoso.com

2.

The 192.168.10.50 IP address to the name host7.fabrikam.com

3.

The name server7.tailspintoys.com to the 192.168.100.101 IP address

Which types of DNS records should you use? To answer, drag the appropriate DNS record types to the correct requirements. Each DNS record type may be used once, more than one, or not at all. You may need to drag the split bar between panes or scroll to view content.
