QUESTION 1

Note: This question is part of a series of questions that use the same or similar answer choices. An answer choice may be correct for more than one question in the series. Each question is independent of the other questions in this series.

Information and details provided in a question apply only to that question.

You need to evaluate the significance of coefficients that are produced by using a model that was estimated already.

Which function should you use?

- A. rxPredict
- B. rxLogit
- C. summary
- D. rxLinMod
- E. rxTweedie
- F. stepAic
- G. rxTransform
- H. rxDataStep

Correct Answer: D

QUESTION 2

You are running a large logistic regression for 1,000 feature variables by using the `LoisticRegression()` function in the `MicrosoftML` package. All of the predictor variables are numeric.

Currently, you specify the input variables separately by using the following formula.

Outcome ~ Feature000 + Feature001 + Feature002 + ... + Feature999

You discover that it takes 20 minutes to estimate each model.

You need to reduce the amount of time required to estimate each model without losing any information in the predictors.

What should you do?

- A. Use `stepControl()` to perform stepwise regression to limit the number of variables that contribute to the model.
- B. Use `selectFeatures()` to select the features that provide the most information about the outcome variable.
- C. Use `princomp()` on the correlation matrix of Features, and then use only the first 100 principle components to reduce the number of input variables.

D. Use `concat()` to create a single array variable named `Features`, and then specify a new formula named `Outcome ~ Features`.

Correct Answer: D

QUESTION 3

Note: This question is part of a series of questions that use the same or similar answer choices. An answer choice may be correct for more than one question in the series. Each question is independent of the other questions in this series.

Information and details provided in a question apply only to that question.

You need to calculate a measure of central tendency and variability for the variables in a dataset that is grouped by using another categorical variable.

What should you use?

- A. the `Describe` package
- B. the `rxHistogram` function
- C. the `rxSummary` function
- D. the `rxQuantile` function
- E. the `rxCube` function
- F. the `summary` function
- G. the `rxCrossTabs` function
- H. the `ggplot2` package

Correct Answer: C

QUESTION 4

Note: This question is part of a series of questions that use the same or similar answer choices. An answer choice may be correct for more than one question in the series. Each question is independent of the other questions in this series.

Information and details provided in a question apply only to that question.

You build a model that uses `xyz` regression.

You need to estimate a model that predicts a binary variable.

Which function should you use?

- A. `rxPredict`
- B. `rxLogit`
- C. `summary`

- D. rxLinMod
- E. rxTweedie
- F. stepAic
- G. rxTransform
- H. rxDataStep

Correct Answer: B

References: <https://docs.microsoft.com/en-us/r-server/r/how-to-revoscaler-logistic-regression>

QUESTION 5

You have a Microsoft SQL Server instance that has R Services (In-Database) installed. The server has a comma-separated values (CSV) file stored in the local file system.

For analytic purposes, you need to read the CSV file into a database table in the SQL Server instance.

You connect to the SQL Server instance by using SQL Server Management Studio.

What should you use from `sp_execute_external_script`?

- A. `RxSqlServerData` and specify the CSV file path in the connection string
- B. `rxDataStep` and specify the CSV file path as the `inFile` argument
- C. `rxImportToXdf` and specify specify the CSV file as the input
- D. `read.csv` and specify the CSV file path as the parameter

Correct Answer: D
