QUESTION 1

The best method to data recovery is:

- A. backup
- B. DFS
- C. RAID
- D. spare drives

Correct Answer: A

A backup, or the process of backing up, refers to making copies of data so that these copies can be used to restore the original after a data-loss event. They can be used to restore entire systems following a disaster or to restore small file sets that were accidentally deleted or corrupted.

QUESTION 2

Which of the following master roles is used for synchronizing cross-domain group membership changes?

- A. Domain Naming Master role
- B. Infrastructure Master role
- C. Schema Master role
- D. RID Master role

Correct Answer: B

The Infrastructure Master role is used for synchronizing cross-domain group membership changes. Incorrect Answers:

A: The Domain Naming Master role is used for controlling the addition and removal of domains from the forest if they are present in the root domain.

C: The Schema Master role is used for controlling and handling updates and modifications to the Active Directory schema.

D: The RID Master role is used for allocating pools of unique identifiers to domain controllers for use when creating objects.

QUESTION 3

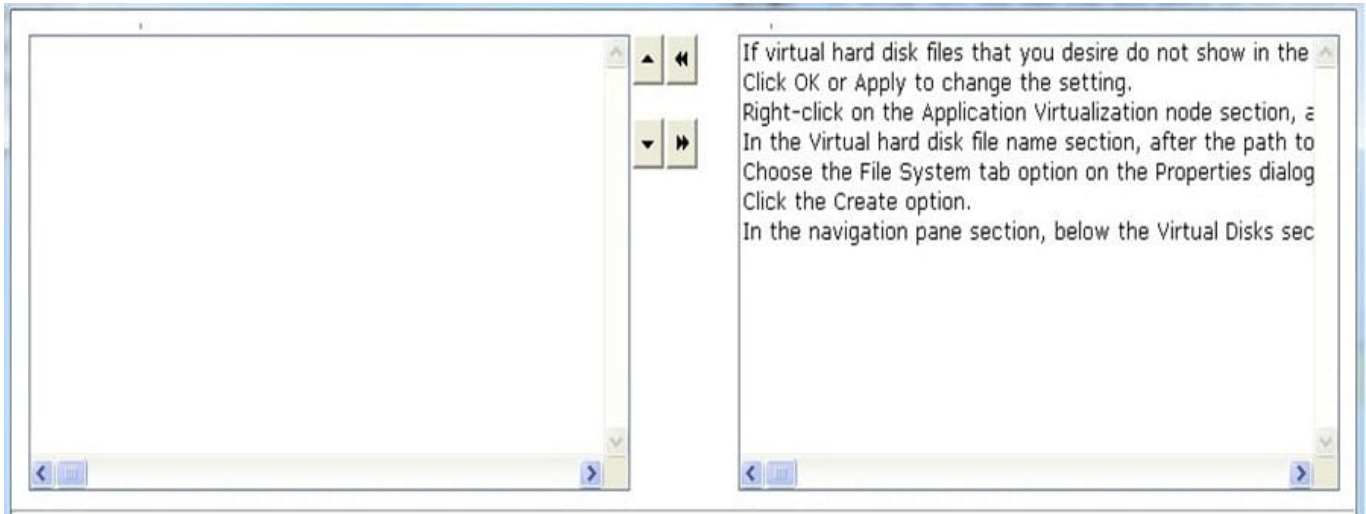

John works as a Virtualization Administrator for company Inc. The company has deployed Windows Server 2016 Server. He needs to change the size of the cache directly from the Application Virtualization node in Application Virtualization

Client Management Console.

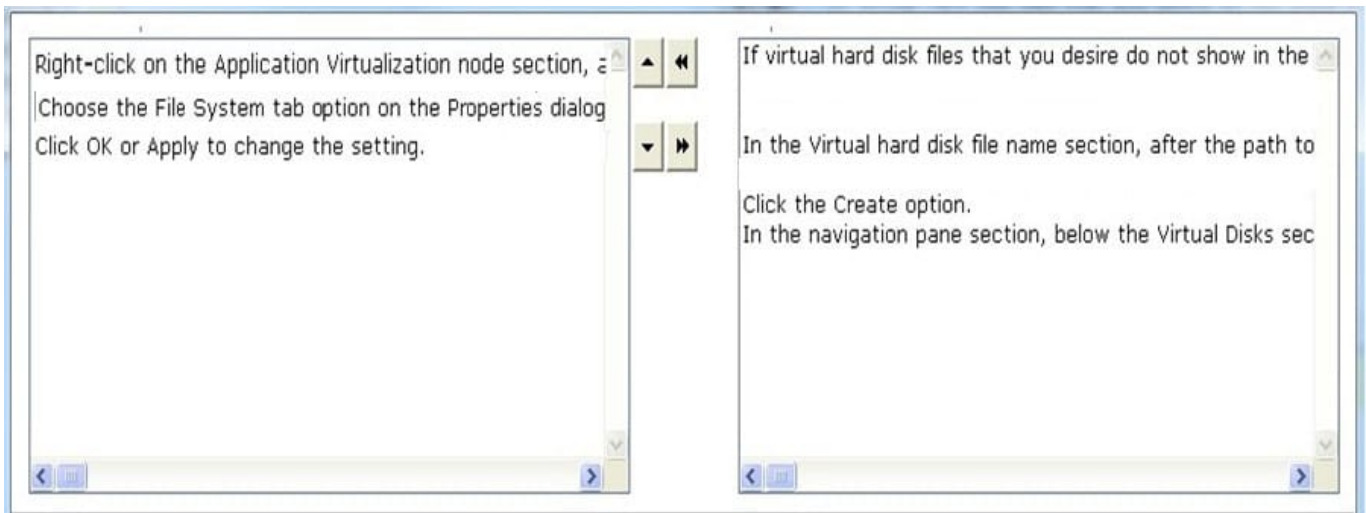

What are the correct and ordered steps for this process?

Select and Place:

Correct Answer:

Right-click on the Application Virtualization node section, and then choose the Properties option from the pop-up menu section.

Choose the File System tab option on the Properties dialog box section. In the Client Cache Configuration Settings section, select and click on one of the following radio buttons to select how to manage the cache space:

Utilize maximum cache size: Enter a numeric value from 100 to 1,048,576 in the Maximum size (MB) field to determine the utmost size of the cache. The value shown in Reserved Cache Size determines the total cache in use.

Utilize free disk space threshold: Enter a numeric value to determine the total of the free disk space, in MB, that the cache must leave available on the disk space. This permits the cache to develop until the amount of free disk space

accomplishes this limit. The numeric value described in free disk space remaining determines how much disk space is unutilized.

Click OK or Apply to change the setting.

QUESTION 4

You work as a System Administrator for company Inc. You have deployed a workstation and roll it out to production, but you find some issues with the video display.

The display worked in the beginning when you first set up the system. The video has degraded to standard VGA 640x800 and its performance is badly affected after applying several system and driver updates.

What is the most likely cause of this issue?

- A. The video adapter is not properly placed on the system board.
- B. The video card is not enabled on the system.
- C. You need to upgrade RAM according to the video driver.
- D. You have installed an unsigned video driver.

Correct Answer: D

In the given scenario, the video problem occurred because of the installation of an unsigned video driver. For better performance, you should always use a device driver that is signed by Microsoft. Unsigned drivers are not compatible with all

systems. They may be poorly written and may include viruses or malware.

Incorrect Answers:

A, B: If the video adapter is not properly placed on the system board or the video card is not enabled, you do not get the video clip in the beginning when you first set up the system.

C: It is not required to upgrade RAM.

QUESTION 5

You work on the Windows Server 2016 environment. You encounter some issues regarding bad sectors formed in the hard disk of your computer.

You want to run the CHKDSK command to check the hard disk for bad sectors.

Which of the following commands will you use to accomplish the task?

- A. CHKDSK/V
- B. CHKDSK/L
- C. CHKDSK/R
- D. CHKDSK/I

Correct Answer: C

In order to accomplish the task, you should use the CHKDSK/R command. This command locates bad sectors and recovers readable information. If CHKDSK cannot lock the volume, it offers to check it the next time the computer starts.
