### QUESTION 1

The number of File Set data files created depends upon what two items? (Choose two.)

- A. Amount of memory.
- B. Schema definition of the file.
- C. Operating system limitations.
- D. Number of logical processing nodes.
- E. Number of disks in the export or default disk pool connected to each processing node in the default node pool.

Correct Answer: DE

---

### QUESTION 2

In the Slowly Changing Dimension stage, a dimension columns Purpose code property can trigger which two actions. (Choose two.)

- A. Update fact table keys.
- B. Detect dimension changes.
- C. Update the dimension table.
- D. Insert rows into the fact table.
- E. Delete duplicate dimension table rows.

Correct Answer: BC

---

### QUESTION 3

Which statement is true about table definitions created in DataStage Designer?

- A. By default, table definitions created in DataStage Designer are visible to other Information Server products.
- B. Table definitions created in DataStage Designer are local to DataStage and cannot be shared with other Information Server products.
- C. When a table definition is created in one DataStage project, it is automatically available in other DataStage projects, but not outside of DataStage.
- D. Table definitions created in DataStage Designer are not by default available to other Information Server products, but they can be shared with other Information Server products.

Correct Answer: D

---

#### QUESTION 4

The data going into the target Sequential Files stage is range-partitioned and sorted.

Which technique method would be the most efficient to create a globally sorted target sequential file?

- A. Select an in-stage sort in the final Sequential File stage.
- B. Select the Ordered collector method for the final Sequential File stage.
- C. Select the Sort Merge collector method for the final Sequential File stage.
- D. Insert a Funnel stage before the final Sequential File stage and select Sequence as Funnel Type.

Correct Answer: B

---

#### QUESTION 5

You have created three parallel jobs (Job A, B and C) in which the output of one job is the input to the other job. You are required to create processing that manages this data relationship of the jobs and provide job level restart-ability.

What two tasks will accomplish these objectives? (Choose two.)

- A. Enable runtime column propagation for the job sequence running the jobs.
- B. Set the '\\Add checkpoints so sequence is restartable\\' option in the Sequencer job.
- C. Enable the '\\Add checkpoints so container is restartable\\' option for each of the parallel shared containers.
- D. Create two parallel shared containers that has the logic of Job B and Job C and include those shared containers in the correct flow order within the design of Job A.
- E. Create a Sequencer job that has triggered events configured allowing Job A to run first, then Job B to run when A completes successfully, and then Job C to run when Job B completes successfully.

Correct Answer: BE
