### QUESTION 1

In a Pro plan project, you notice there is an email delivery problem in the Integration environment. How do you troubleshoot this?

- A. Change the log level in the log:email section of the .magento.env.yaml file
- B. Update the SPF record in the DNS
- C. Look in the var/log directory for the mail.log file
- D. Move the test to the Staging environment

Correct Answer: D

---

### QUESTION 2

For the Magento search backend you would like to move from MySQL to Elasticsearch for your existing project. You have confirmed that your services.yaml file is configured appropriately. However, after your most recent deployment, you notice the search engine is still set to MySQL.

What additional step must be completed?

- A. Configure the relationships Section of the .magento.app.yaml file
- B. Find an appropriate Elasticsearch module to require with Composer
- C. Specify Elasticsearch as the search engine in the Magento Admin panel
- D. Remove the MySQL service from the services.yaml file

Correct Answer: A

---

### QUESTION 3

You are migrating an existing Magento 2 website to Magento Commerce Cloud. After setting up the project you would like to migrate the database to the integration branch. The database import fails with a disk space error.

How do you migrate the database data?

- A. Configuration the mysql disk size using a variable in the .magento.env.yaml file
- B. Open a Magento Support ticket to increase the Integration branch disk size
- C. Trim down the database to a smaller size
- D. Configure the mysql disk size in the .magento/services.yaml file

Correct Answer: D

---

#### QUESTION 4

To secure composer credentials you want to remove the auth. json file from the project repository. How do you do that?

- A. The build phase runs on a separate server and variables are not available there you must keep the credentials in the auth. json file, but you can replace the password with its hash
- B. Add the env:composer\_auth variable on the project level and make it visible on the build phase
- C. Put the composer credentials into /mnt/build/.config/composer/auth.json
- D. Add the composer\_auth variable with the sensitive option enabled

Correct Answer: B

---

#### QUESTION 5

You add a new Composer dependency utilizing composer require. After testing composer install locally, you add the Composer local and json files and perform a deployment. The build phase fails as Composer is unable to resolve the dependencies.

Why does this happen?

- A. The versions of PHP on your local environment and integration environment differ
- B. Your commit needs to contain the updated vendor folder
- C. The project cache should have been cleared with the magento-cloud:project-build-cache command
- D. You did not execute the install locally with --require-dev

Correct Answer: A
