### QUESTION 3

#### SIMULATION

You plan to deploy several Azure virtual machines and to connect them to a virtual network named VNET1007.

You need to ensure that future virtual machines on VNET1007 can register their name in an internal DNS zone named corp8548984.com. The zone must NOT be hosted on a virtual machine.

What should you do from Azure Cloud Shell?

To complete this task, start Azure Cloud Shell and select PowerShell (Linux), Click Show Advanced settings, and then enter corp8548984n1 in the Storage account text box and File1 share text box. Click Create storage, and then complete

the task.

Correct Answer: See solution below.

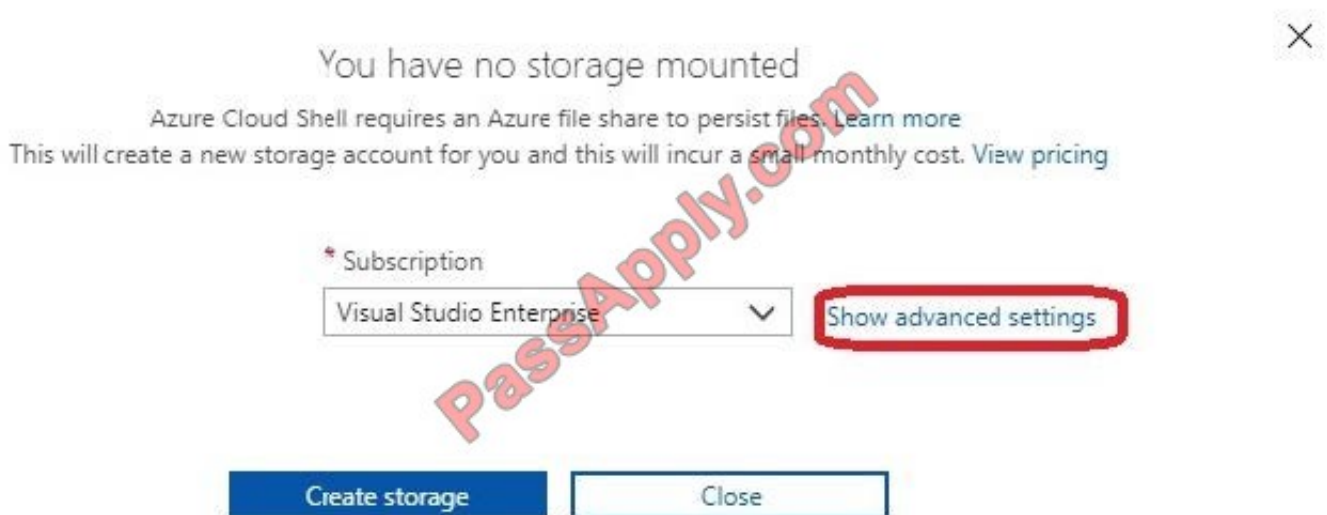

Step 1: Launch Cloud Shell from the top navigation of the Azure portal.

Step 2: Select PowerShell

When you start the Azure Cloud Shell for the first time, you will be prompted to create a storage account in order to associate a new Azure File Share to persist files across sessions. Step 3: Click Show Advanced settings.

Step 4: Enter corp8548984n1 in the Storage account text box and File1 share text box. Click Create storage.

Step 5: Enter the following command at the powershell command prompt:

```
New-AzDnsZone -Name "corp8548984.com"  
  
-ResourceGroupName "mycloudshell"  
  
-ZoneType Private  
  
-RegistrationVirtualNetworkId VNET1007
```

Note: A DNS zone is created by using the New-AzDnsZone cmdlet with a value of Private for the ZoneType parameter.
