-  **365 Days** Free Update
-  **800,000+** Satisfied Customers

QUESTION 1

How can a virtual machine be protected using the IBM Tivoli Storage Manager Backup-Archive client?

- A. Install the Backup-Archive client on an ESX server.
- B. Install the Backup-Archive client on a virtual center.
- C. Install the Backup-Archive client directly in the virtual machine.
- D. Only install the Backup-Archive client on the physical machine.

Correct Answer: C

Perform some file level restores of these backups using the Tivoli Storage Manager |Backup- Archive Client running within the virtual machine.

QUESTION 2

What is the result when the migrate process moves data from a deduplicated pool to a non- deduplicated pool?

- A. The migration process fails.
- B. The target pool is marked as deduplicated.
- C. The data is reconstituted on the target pool.
- D. The data in both storage pools is reconstituted.

Correct Answer: B

* Data deduplication in Tivoli Storage Manager is a two-phase process. In the first phase, the server identifies the duplicate data in the storage pool. As volumes in the storage pool are filled, data becomes eligible for duplicate identification. A volume does not have to be full before duplicate identification starts. In the second phase, duplicate data is removed by any of the following processes:

Reclaiming volumes in the primary-storage pool, copy-storage pool, or active-data pool
Backing up a primary-storage pool to a copy-storage pool that is also set up for deduplication
Copying active data in the primary-storage pool to an active-data pool that is also set up for deduplication
Migrating data from the primary-storage pool to another primary-storage pool that is also set up for deduplication
Moving data from the primary-storage pool to a different primary-storage pool that is also set up for deduplication, moving data within the same copy-storage pool, or moving data within the same active-data pool

QUESTION 3

Which level of IBM Tivoli Storage Manager administrator authority includes the ability to restore node data from a remote system to a local system?

- A. storage
- B. system

- C. operator
- D. client access

Correct Answer: C

The Backup Operators group allows users to back up and restore files regardless of whether they have read or write access to the files. Since this group has a limited set of user rights, some functions are not available to members of the Backup Operators group.

QUESTION 4

Which two types of server tasks are shown in the Operations Center?

- A. active
- B. db reorgs
- C. encrypted
- D. completed
- E. missed schedules

Correct Answer: AE

A: TSM Servers

The status indicator shows whether the Tivoli Storage Manager servers that are managed by the Operations Center are available to provide data protection services to clients.

E: TSM Clients

A client is considered to be at risk if a problem occurs during its most recent scheduled backup, or during a backup that starts within a specified time interval. The term backup also includes archive operations for Tivoli Storage Manager for

Enterprise Resource Planning clients. Use the information that is shown in the TSM Clients section to check for failed or missed backups and to determine whether backup schedules are running as expected.

QUESTION 5

Which two statements describe the process of collocation?

- A. Placing IBM Tivoli Storage Manager (TSM) database volumes in the same directories.
- B. Isolating archive and backup data to separate storage pools.
- C. Combining multiple TSM servers onto a single physical server.
- D. Isolating a client or group of clients to their own volumes within a storage pool.
- E. Isolating a single or group of filespaces to their own volumes within a storage pool.

Correct Answer: DE

*

When collocation is by client node Volume selection order: 1st: A volume that already contains files from the same client node

*

When collocation is by file space Volume selection order: 1st: A volume that already contains files from the same file space of that client node

Note: With collocation enabled, the server attempts to keep files belonging to a group of client nodes, a single client node, or client file space on a minimal number of sequential-access storage volumes. Collocation reduces the number of volume mounts required when users restore, retrieve, or recall a large number of files from the storage pool. Collocation thus reduces the amount of time required for these operations.
