### QUESTION 1

Why do you use the debug query mode in a calculation view?

- A. To observe the generated SQL for each node
- B. To highlight potential performance issues at design-time
- C. To measure the overall run-time of the query
- D. To check which database engines will be invoked by each node

Correct Answer: A

---

### QUESTION 2

In your calculation view, you need to define a custom data source using SQLScript. In which object do you write your SQL Script?

- A. Table function
- B. CDS view
- C. Procedure
- D. Virtual Table

Correct Answer: A

---

### QUESTION 3

In SAP Web IDE, you rename a dimension calculation view that is used by a cube calculation view. Afterward, you perform the following build operations:

\*Build the dimension calculation view as a single object.

\*Build the entire SAP HANA database module. What is the outcome of the build operations?

- A. The first build fails. The second build fails.
- B. The first build is successful. The second build is successful.
- C. The first build fails. The second build is successful.
- D. The first build is successful. The second build fails.

Correct Answer: B

---

### QUESTION 4

Why does query performance decrease when the data volume of the delta storage is large?

Note: There are 2 correct answers to this question.

- A. The data is unstructured.
- B. The data is uncompressed.
- C. The data is stored in the warm tier.
- D. The data is NOT sorted.

Correct Answer: BD

---

#### QUESTION 5

Which of the following techniques can you use to improve the performance of calculation views?

Note: There are 2 correct answers to this question.

- A. Limit the number of stacked calculation views
- B. Avoid aggregating data early in the dataflow
- C. Implement union pruning
- D. Partition large tables

Correct Answer: AD
