QUESTION 1

When planning RAID for an N8500 clustered NAS storage system, you are advised to configure RAID 10 for database services and random read/write services.

- A. True
- B. False

Correct Answer: A

QUESTION 2

Which of the following statements about the performance optimization check items of the N8500 clustered NAS storage systems are correct? (Select three)

- A. Check whether the BBUs are faulty. If only one BBU is faulty, the current write policy of LUNs changes to write through.
- B. Log in to the ISM and check whether alarms indicating slow disk response exist.
- C. Check on the ISM whether bit errors exist on Fibre Channel ports.
- D. Check whether front-end service ports are functioning at the optimal rate. For example, check whether the port rate is 4 Gbit/s when the bandwidth is 8 Gbit/s.

Correct Answer: BCD

QUESTION 3

Which are the characteristics of the OceanStor 9000 M node? (Select two.)

- A. 2U
- B. Up to 12 service disk slots
- C. Applicable to scenarios requiring large capacity
- D. Standard configuration: 2 x 6-core CPUs

Correct Answer: AB

QUESTION 4

Which of the following statements about the InfoLink feature of the OceanStor 9000 are correct? (Select two.)

- A. If clients attempt to access the OceanStor 9000 using domain names, the InfoLink license must be activated.
- B. If clients attempt to access the OceanStor 9000 using domain names, a DNS server must be configured.

C. If a node becomes faulty, the system provides the failover function. This function does not need the InfoLink license to be activated.

D. After the InfoLink license is activated, the system balances loads based on round robin, CPU usage, number of node connections, node throughput, and comprehensive node loads.

Correct Answer: AD

QUESTION 5

The N8500 clustered NAS storage system supports bonding of multiple service network ports. Which of the following statements about bond4 and bond6 are correct? (Select three)

A. The bond4 mode has unbalanced load issues in the "gatewayed" topology.

B. The bond6 mode allocates and adjusts loads based on the workloads on the bond ports.

C. The bond6 mode supports fault tolerance whereas the bond4 mode does not.

D. The adaptive load balancing supported by the bond6 mode will definitely cause frequent switchovers among network adapters, increasing the system overhead.

Correct Answer: ABD
