QUESTION 1

Nova is a virtual server deployment and service computing module developed by NASA. Which of the following statements about common terms in components is incorrect?

A. Flavor refers to the configuration template created for the VM instance

B. Security group rules are used to define remote access permissions for users

C. keypair refers to the key pair used when a user remotely connects to an instance through SSH

D. A security group is a group that assigns instances to start and stop operations

Correct Answer: C

QUESTION 2

Data backup can be used to prevent logical errors such as misoperations and viruses. Data backup ensures that the system can be restored to a correct logical version.

A. True

B. False

Correct Answer: A

QUESTION 3

The VPC subnet segment in the Huawei FusionCloud solution can be modified after being created.

A. True

B. False

Correct Answer: A

Reference: https://support.huawei.com/enterprise/en/doc/EDOC1100043116/1b317d3b/managing-subnets

QUESTION 4

In the service migration scenario, which of the following statements about the service switchover procedure is incorrect?

A. After the new server is enabled; you do not need to change the corresponding record on the DNS server

B. For all service systems that connect to the source server, set the connection change to the destination server

C. After the migration, check the system CPU, memory, and network performance and service access

D. Stop the source server, synchronize data again (prevent new data generated during the migration), and enable the destination server

Correct Answer: D

QUESTION 5

In the cloud data center migration scenario, which of the following statements about configuring eDevLUNs for heterogeneous virtualization is correct?

A. The read/write policy of eDevLUNs "write-back" applies to random access services, ensuring that data in the cache is cached as long as possible to improve the read hit ratio.

B. The default read/write policy of eDevLUNs is applicable to common services to balance the hit ratio and disk access performance.

C. The read/write policy "Pairing" of eDevLUNs applies to sequential access services to release cache resources for other services as soon as possible.

D. When the eDevLUN reads data, it reads the data to be read from the hard disk in advance based on the specified policy.

Correct Answer: A
