### QUESTION 1

You work as the network administrator at ABC.com. The ABC.com network consists of a single Active Directory domain named ABC.com. The servers at the ABC.com network run Windows Server and the workstations, Windows XP Professional.

The ABC.com network has a DNS server named ABC-SR03 that does name resolution for host on the Internet. ABC.com users complain that they do not get the correct site when trying to access Web site known to them.

What actions must you take to stop this from happening without disrupting production?

- A. You should restart the DNS Server service.
- B. You should select the Secure cache against pollution setting.
- C. You should run the ipconfig/flushdns on ABC-SR03.
- D. You should run the ipconfig/registerdns on ABC-SR03.

Correct Answer: B

---

### QUESTION 2

You've just created a new zone in DNS on a Windows Server -based computer. You check the zone and notice that the only records in it are the SOA and NS RRs. You check the configuration and see that the zone is configured to accept dynamic updates. What should you do next?

- A. Manually add all RR for the zone including A, CNAME, PTR, and SRV records.
- B. Manually add A RR for all hosts that cannot use dynamic updating.
- C. Manually add A RR and PTR RR for all hosts that will be using dynamic updating.
- D. Manually initiate a zone transfer to replicate all the needed RR to the new zone.

Correct Answer: B

---

### QUESTION 3

You are working as the administrator at ABC.com. Part of your job description includes the deployment of applications on the ABC.com network. To this end you operate by testing new application deployment in a test environment prior to deployment on the production network.

The new application that should be tested requires 2 processors and 3 GB of RAM to run successfully. Further requirements of this application also include shared folders and installation of software on client computers. You install the application on a Windows Server Web Edition computer and install the application on 30 test client computers.

During routine monitoring you discover that only a small amount of client computers are able to connect and run the application. You decide to turn off the computers that are able to make a connection and discover that the computers that failed to open the application can now run the application.

How would you ensure that all client computers can connect to the server and run the application?

- A. By running a second instance of the application on the server.
- B. By increasing the Request Queue Limit on the Default Application Pool.
- C. By modifying the test server operating system to Window Server Standard Edition.
- D. By increasing the amount of RAM in the server to 4GB.

Correct Answer: C

---

#### QUESTION 4

You are working as the administrator at ABC.com. The network consists of a single Active Directory domain named ABC.com with the domain functional level set at Windows Server. All network servers run Windows Server and all client computers run Windows XP Professional.

The ABC.com domain is divided into organizational units (OU). All the resource servers are contained in an OU named ABC\_SERVERS and the workstations are contained in an OU named ABC\_CLIENTS. All resource servers operate at near capacity during business hours. All workstations have low resource usage during business hours.

You received instructions to configure baseline security templates for the resource servers and the workstations. To this end you configured two baseline security templates named ABC\_SERVERS.inf and ABC\_CLIENTS.inf respectively. The ABC\_SERVERS.inf template contains many configuration settings. Applying the ABC\_SERVERS.inf template would have a performance impact on the servers. The ABC\_CLIENTS.inf contains just a few settings so applying this template would not adversely affect the performance of the workstations.

How would you apply the security templates so that the settings will be periodically enforced whilst ensuring that the solution reduces the impact on the resource servers? (Choose three.)

- A. By setting up a GPO named SERVER-GPO and link it to the ABC\_SERVERS OU.
- B. By having the ABC\_SERVERS.inf template imported into SERVER-GPO.
- C. By having the ABC\_SERVERS.inf and the ABC\_CLIENTS.inf templates imported into the Default Domain Policy GPO.
- D. By scheduling SECEDIT on each resource server to regularly apply the ABC\_SERVERS.inf settings during off-peak hours.
- E. By having a GPO named CLIENT-GPO created and linked to the ABC\_CLIENTS OU.
- F. By having the ABC\_CLIENTS.inf template imported into CLIENT-GPO.
- G. By having SERVER-GPO and CLIENT-GPO linked to the domain.

Correct Answer: DEF

---

#### QUESTION 5

You administer your company's network. A single-domain Active Directory forest is configured on the network. All servers run Windows Server.

The network contains a server named Server5 that hosts confidential business data. Access to Server5 must be restricted to only a few authorized personnel. You must ensure that those users, including designated Server5 administrators,

cannot share Server5's desktop with other users.

What should you do?

- A. Disable Remote Assistance in the local policy on Server5.
- B. Create a new OU, move Server5 to the OU, create a GPO that disables Remote Assistance, and link the GPO to the OU.
- C. Create a new OU, move Server5 to the OU, create a GPO that disables Remote Desktop, and link the GPO to the OU.
- D. Disable Remote Desktop in the local policy on Server5.
- E. Disable Remote Assistance in System Properties on Server5.
- F. Disable Remote Desktop in System Properties on Server5.

Correct Answer: B
