QUESTION 1

Your network contains an Active Directory domain named contoso.com. All domain controllers run Windows Server 2012 R2. The forest functional level is Windows Server 2012.

Your company plans to deploy an application that will provide a search interface to users in the company. The application will query the global catalog for the Employee-Number attribute. You need to recommend a solution to ensure that the application can retrieve the Employee-Number value from the global catalog.

What should you include in the recommendation?

- A. the Ldifde command
- B. the Set-ADServerSettings cmdlet
- C. the Set-ADUser cmdlet
- D. the Csvde command

Correct Answer: A

Ldifde creates, modifies, and deletes directory objects. You can also use Ldifde to extend the schema, export Active Directory user and group information to other applications or services, and populate Active Directory Domain Services (AD

DS) with data from other directory services.

Ldifde -l

Sets the list of attributes to return in the results of an export query. If you do not specify this parameter, the search returns all attributes.

QUESTION 2

Your network contains an Active Directory forest named contoso.com. The forest contains one domain. All domain controllers run Windows Server 2012. The functional level of the forest and the domain is Windows Server 2012.

Domain controller name	Role
DC1	Schema operations master Domain naming operations master Global catalog server
DC2	Infrastructure operations master
DC3	Relative identifier (RID) operations master PDC emulator operations master

The domain contains three domain controllers. The domain controllers are configured as shown in the following table. In the forest, you plan to add a new domain controller that runs Windows Server 2012 R2.

You need to prepare the environment before you add the new domain controller.

Answer Area

Adprep /forestprep

Adprep /domainprep

Adprep /rodcrep

Which domain controllers must be available to run each command? To answer, select the appropriate domain controllers in the answer area.

Hot Area:

Answer Area

Adprep /forestprep

Adprep /domainprep

Adprep /rodcrep

Correct Answer:

Answer Area

Adprep /forestprep

Adprep /domainprep

Adprep /rodcrep

*

adprep /forestprep

Must be run on the schema operations master for the forest (here DC1).

Once for the entire forest

*

```
adprep /domainprep
```

Must be run on the infrastructure operations (DC2) master for the domain.

*

```
adprep /rodcprep
```

Can be run from any computer. This command performs operations remotely. For the operations to complete successfully, the domain naming operations master 1) for the forest and the infrastructure operations master (DC2) for each

application directory partition and each domain partition must be accessible.

Reference: Running Adprep.exe

QUESTION 3

You have an Active Directory domain named adatum.com. The domain contains a server named VMM1 that runs Microsoft System Center 2012 Virtual Machine Manager (VMM) Service Pack 1 (SP1). You plan to deploy 300 virtual machines and a multi-tier application named App1 by using VMM1 to meet the following requirements:

1.

The virtual machines must have identical settings for CPU and Memory.

2.

The configuration settings for the first tier of App1 must be deployed to the virtual machines in the first tier.

You add a PXE server to the fabric.

You need to identify which two objects must be added to the VMM library for the planned deployment.

What two objects should you identify? Each correct answer presents part of the solution.

- A. A host profile
- B. A capability profile
- C. A hardware profile
- D. A generalized image
- E. A service template

Correct Answer: CE

QUESTION 4

Your network contains an Active Directory domain named contoso.com.

You deploy several servers that have the Remote Desktop Session Host role service installed.

You have two organizational units (OUs). The OUs are configured as shown in the following table.

OU name	Group Policy link	Contents
OU1	GPO1	Sales department user accounts
OU2	GPO2	Computer accounts of the Remote Desktop Session Host (RD Session Host) server

GPO1 contains the Folder Redirection settings for all of the users.

You need to recommend a solution to prevent the sales users' folders from being redirected when the users log on to a Remote Desktop session.

What should you include in the recommendation?

- A. From GPO2, set the loopback processing mode.
- B. From GPO1, set the loopback processing mode.
- C. Configure security filtering for GPO1.
- D. Apply a WMI filter to GPO2.

Correct Answer: A

Group Policy applies to the user or computer in a manner that depends on where both the user and the computer objects are located in Active Directory. However, in some cases, users may need policy applied to them based on the location of the computer object alone. You can use the Group Policy loopback feature to apply Group Policy Objects (GPOs) that depend only on which computer the user logs on to.

QUESTION 5

Your network contains an Active Directory forest. The forest contains two Active Directory domains named contoso.com and child.contoso.com. The forest functional level is Windows Server 2008. The functional level of both domains is Windows Server 2008 R2.

The forest contains three domain controllers. The domain controllers are configured as shown in the following table.

Domain controller name	Domain	Operations master role
DC1	Contoso.com	Schema master Domain naming master
DC2	Contoso.com	PDC emulator Infrastructure master RID master
DC3	child.contoso.com	PDC emulator Infrastructure master RID master

DC1 and DC2 have the DNS Server server role installed and are authoritative for both contoso.com and child.contoso.com.

The child.contoso.com domain contains a server named server1.child.contoso.com that runs Windows Server 2012.

You plan to deploy server1.child.contoso.com as a read-only domain controller (RODC).

You run the adprep.exe /rodcprep command on DC3 and receive the following error message:

```
"Adprep could not contact a replica for partition DC=DomainDnsZones,DC=Contoso,DC=com  
Adprep failed the operation on partition DC=DomainDnsZones,DC=Contoso,DC=com Skipping to next partition.  
  
Adprep could not contact a replica for partition DC=ForestDnsZones,DC=Contoso,DC=com  
Adprep encountered an LDAP error. Error code: 0x0. Server extended error code: 0x0, Server error message: (null).  
  
Adprep failed the operation on partition DC=ForestDnsZones,DC=Contoso,DC=com Skipping to next partition.  
  
Adprep completed with errors. Not all partitions are updated."
```

You need to identify what prevents you from successfully running Adprep /rodcprep on DC3. What should you identify?

- A. The domain functional level of child.contoso.com is set to the wrong level.
- B. DC3 cannot connect to the infrastructure master on DC2.
- C. DC3 cannot connect to the domain naming master on DC1.
- D. The forest functional level is set to the wrong level.

Correct Answer: B

Adprep could not contact a replica...

This problem occurs when the Adprep /rodcprep command tries to contact the infrastructure master for each application partition in the forest.

QUESTION 6

You are planning the implementation of two new servers that will be configured as RADIUS servers.

You need to recommend which configuration must be performed on the VPN servers. The solution must meet the technical requirements.

What should you do on each VPN server?

- A. Add a RADIUS client.
- B. Install the Health Registration Authority role service.
- C. Enable DirectAccess.
- D. Modify the authentication provider.

Correct Answer: D

*

Implement RADIUS authentication for VPN connections.

*

The new sales.contoso.com domain will contain a web application that will access data from a Microsoft SQL Server located in the contoso.com domain. The web application must use integrated Windows authentication. Users\' credentials must be passed from the web applications to the SQL Server.

QUESTION 7

You work as a Network Administrator for ABC.com. The network consists of a single Windows Server 2003 R2 Active Directory domain named ABC.com. All servers in the domain run Windows Server 2003 R2. The company has a main office in London. A domain controller named TK-LonDC1 in the London office runs all the FSMO roles. A branch office in Madrid is connected to the main office by a reliable WAN link. A server named TK-MadDC1 is configured as a domain controller in the Madrid office.

The company plans to open a branch office in Barcelona. The Barcelona office connects to the Madrid office by a reliable WAN link. An Active Directory site exists for each of the three offices. You plan to install a read-only domain controller (RODC) in the Barcelona office.

What would you need to do before you can deploy an RODC in the Barcelona office?

- A. Replace TK-LonDC1 with a Windows Server 2012 domain controller.
- B. Configure a site link between the Barcelona and London sites.
- C. Replace TK-MadDC1 with a Windows Server 2012 domain controller.
- D. Enable site link bridging in the Madrid site.

Correct Answer: C

Reference: <https://www.windows-active-directory.com/read-only-domain-controller.html#:~:text=A%20read%20only%20domain%20controller,and%20in%20its%20succeeding%20versions.>

QUESTION 8

Your company has a main office that contains several servers and several users. The main office contains a file server named Server1 that runs Windows Server 2012 R2.

The users access a large report file that is created on Server1 each day.

The company plans to open a new branch office. The branch office will contain only client computers.

You need to implement a solution to reduce the amount of bandwidth used by the client computers in the branch office to download the report each day.

What should you do?

More than one answer choice may achieve the goal. Select the BEST answer.

- A. Install the BranchCache for network files role service on Server1. Configure the client computers to use BranchCache in hosted cache mode.
- B. Configure the offline settings of the shared folder that contains the report.
- C. Install the BranchCache for network files role service on Server1. Configure the client computers to use Branchcache in distributed mode.
- D. Enable the Background Intelligent Transfer Service (BITS) feature on Server1 and on each client computer in the branch office. Move the report to a web folder.

Correct Answer: C

Distributed cache mode. In this mode, branch office client computers download content from the content servers in the main office and then cache the content for other computers in the same branch office. Distributed cache mode does not require a server computer in the branch office.

QUESTION 9

HOTSPOT

You need to design the acquisition strategy for Margie\\'s Travel.

What should you do? To answer, select the appropriate option for each action in the answer area.

Hot Area:

Answer Area

Action	
Install the Active Directory Migration Tool on server:	
Specify the following user account option:	

Correct Answer:

Answer Area

Action	
Install the Active Directory Migration Tool on server:	
Specify the following user account option:	

QUESTION 10

DRAG DROP

Your network contains an Active Directory domain named adatum.com. The domain contains a server named CA1 that

runs Windows Server 2008. CA1 is configured as an enterprise subordinate certification authority (CA).

You plan to replace CA1 with a new member server that was purchased recently. The new server is named CA2 and runs Windows Server 2012.

You back up all of the data on CA1, and then export the private and public keys of the CA. CA1 is decommissioned.

You need to identify which actions must be performed on CA2 to restore the certificate services of CA1.

Which three actions should you identify? To answer, move the three appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Actions	Answer Area
Run the AD CS Configuration wizard and import the public key.	
Run the AD CS Configuration wizard and import the private key.	
Restore the certificate services registry settings and the certificate services database.	
Install the Active Directory Certificate Services server role.	

Correct Answer:

Actions	Answer Area
Run the AD CS Configuration wizard and import the public key.	Install the Active Directory Certificate Services server role.
	Run the AD CS Configuration wizard and import the private key.
	Restore the certificate services registry settings and the certificate services database.

QUESTION 11

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

A company has offices in multiple geographic locations. The sites have high-latency, low-bandwidth connections. You need to implement a multisite Windows Deployment Services (WDS) topology for deploying standard client device

images

to all sites.

Solution: At each site, you install a WDS Server. You apply the same configuration settings to each WDS Server. You configure Distributed File Server Replication (DFSR) to synchronize install images. Does this meet the goal?

A. Yes

B. No

Correct Answer: A

QUESTION 12

You need to recommend an Office 365 integration solution.

What should you include in the recommendation?

A. Active Directory directory synchronization

B. The Active Directory Migration Tool (ADMT)

C. Windows Identity Foundation (WIF) 3.5

D. The Sync Framework Toolkit

Correct Answer: A

* Scenario: Each office is configured as an Active Directory site.
