QUESTION 1

Which statement is true about a temporal trigger?

- A. It responds to changes detected within the ObjectServer.
- B. It is executed repeatedly based on a specified frequency.
- C. It can only be executed if the system is running under process control.
- D. It can only be executed before or after an event is updated in the ObjectServer

Correct Answer: B

QUESTION 2

The network operation center has two groups of users that use the native desktop One group, OPERATIONS, requires access to the standard event management tools like acknowledge and delete. They also require access to some custom tools for things like basic troubleshooting (ping and telnet) and ticket creation. The second group, NETWORK, requires access to the same tools used by the OPERATIONS group users. In addition, there are a few tools used for advanced router diagnostics that they use. These tools are not to be available to the OPERATIONS group users. To minimize administration efforts a common desktop menu is used for both groups of users.

The RouterDiag tool, used by NETWORK users, is defined in a menu called DiagTools. The tool is only used for Acme routers. The Acme routers produce SNMP traps, which are converted to events by the MTTrapd probe.

Which option limits this tool for use with only Acme routers?

- A. configure the mtrtrpd.rules file to populate the alerts.status Class column with the value 9999; configure the RouterDiagtool to limit access to only the 9999 Class
- B. configure the mtrtrpd.rules file to populate the alerts.status Class column with the value 9999; configure the DiagToolsmenu to limit access to only the 9999 Class
- C. configure the mtrtrpd.rules file to populate the alerts.status Group column with the value ACME; configure theRouterDiag tool to limit access to only the ACME Group
- D. configure the mtrtrpd.rules file to populate the alerts.status Group column with the value NETWORK; configure theRouterDiag tool to limit access to only the Network Group

After performing stress testing on the new IBM Tivoli Netcool/OMNIbus V7 4 (Netcool/OMNIbus) single tier deployment,

the Netcool/OMNibus administrator notices the combined average profiling and trigger statistics log file data shows that the primary aggregation ObjectServer AGG_P is using 50 seconds on average out of its 60 second granularity cycle

On further inspection of the log files, the administrator sees that the grouped user profile PROBE is the biggest consumer using just over 30 seconds of the 60 second granularity Which two actions help decrease the load by this user profile group? (Choose two)

- A. delete the contents of the alerts.details table
- B. deploy further probes to share the load of the incoming event stream
- C. review the events and implement event discards of unwanted events within the probe rules file
- D. deploy a Display layer using the standard multi-tier architecture configuration and move the probes to the Display layer
- E. deploy a Collection layer using the standard multi-tier architecture configuration and move the probes to the Collectionlayer

Correct Answer: CE
