### QUESTION 1

A client has two regional offices that use SnapMirror cross-site replication to host disaster-recovery mirrors for both offices. A co-worker at one office is requesting read/write access to one of the volume mirrors. You must accomplish this task without interrupting data access or replication. In this scenario, how should you proceed?

- A. Create a FlexVol volume on the destination cluster so that it is writeable for the co-worker.
- B. Create a FlexClone volume based on one of the Snapshot copies at the destination so that it is writeable for the co-worker.
- C. Break the SnapMirror relationship between the local and remote clusters, and make the destination volume writeable for the co-worker.
- D. Modify the export policy on the destination mirror volume so that it is now writeable for the co-worker.

Correct Answer: B

- A. ONTAP references metadata when creating Snapshot copies instead of copying data blocks.
- B. The Snapshot policy is defined to create the Snapshot copy with only the most recent data changes.
- C. ONTAP uses data from all Snapshot copies when restoring of the volume is necessary.
- D. The Snapshot copies are created by using a background process that takes time to build.
